THE

IMPERIAL DICTIONARY,

ENGLISH, TECHNOLOGICAL, AND SCIENTIFIC.

J. THIS letter, although very ancient, has been added to the English alphabet only in modern days. Its form was originally identical with that of I, and it is only within the last century that any distinction was made between them. The separation of these two letters in English dictionaries is of still more recent date. It seems to have had the sound of *y* in many words, as it still has in the German. The English sound of this letter may be expressed by *dzh*, or *edzh*, a compound sound coinciding exactly with that of *g*, in *genius*; the French *j*, with the articulation *d* preceding it. It is the tenth letter of the English Alphabet, and the seventh consonant. In Latin abbreviations I is frequently used for J: thus, we often find I.H.S. for J.H.S., signifying *Jesus Hominum Salvator*, Jesus the Saviour of men. J.P. is an abbreviation for Justice of the Peace.

Numerous species are described. The Jacamars are arranged by Cuvier in a separate genus, Galbula, and along with the woodpeckers in the order of climbers. Their plumage has a metallic lustre. They live in damp woods and feed on insects. Most if not all the true Jacamars are natives of tropical America. Several species are found in India.

This is effected by means of an endless screw working into the worm wheel *c*, which forms the nut of the screw. On the lower end of the screw is fixed the claw *d* passing through a groove in the stock; this claw serves at once to prevent the screw *b* from turning and to raise bodies which lie near the ground. JES'UIT, *n.* (*s* as *z.*) One of the society of Jesus, so called, founded by Ignatius Loyola, in the sixteenth century. The Jesuits form the most celebrated of all the Romish religious orders; they have, ever since their origin, been one of the main bulwarks of the church of Rome, and have exercised immense influence in the destinies of the Christian world. To the qualities of great learning, policy, and address, they are generally considered to join those of craft, equivocation, and deceit. So formidable and dangerous was their political influence supposed to be, even in Roman Catholic communities, that the troubles occasioned by their presence, often ended in their expulsion. Thus, though the order was founded only in 1536, the Jesuits were driven from France in 1594, but recalled in 1605; they were expelled from England in 1604; from Venice in 1606; from France in 1764; from Spain in 1767; and from Naples in 1768. In 1773, the order was nominally (and, as was supposed, finally) suppressed by pope Clement XIV. (July 21st,) but it has revived again in our own times; for the Jesuits, either under that name, or other appellations (such as "brothers of the congregation," &c.) have, by their open pretensions or subtle influences, caused many troubles in several Continental states. The French revolution of 1830 was precipitated by their intrigues, although their efforts were meant to avert it; and they had a considerable hand in that of Belgium, which soon followed. In 1846-7, a short but sharp intestine convulsion in Switzerland was mainly owing to them.—By the Roman Catholic Relief Bill, natural-born Jesuits, resident in the United Kingdom, are required to register themselves with the clerk of the peace in every county; and foreign Jesuits are not allowed to enter the United Kingdom, unless by special license in writing.

The legal power or authority of doing justice in cases of complaint; the power of executing the laws and distributing justice. Thus we speak of certain suits or actions, or the cognizance of certain crimes being within the *jurisdiction* of a court, that is, within the limits of their authority or commission. Inferior courts have *jurisdiction* of debt and trespass, or of smaller offences; the supreme courts have *jurisdiction* of treason, murder, and other high crimes. *Jurisdiction* is secular or ecclesiastical. *Secular* jurisdiction is either civil or criminal.—2. The power or right of exercising authority. Nations claim exclusive *jurisdiction* on the sea, to the extent of a marine league from the main land or shore. 4. The limit within which power may be exercised. *Jurisdiction*, in its most general sense, is the power to make, declare, or apply the law; when confined to the judiciary department, it is what we denominate the *judicial power*, the right of administering justice through the laws, by the means which the laws have provided for that purpose. *Jurisdiction* is limited to place or territory, to persons, or to particular subjects.

JU'RY, *n.* [Fr. *juré*, sworn; L. *juro*, to swear.] A certain number of men sworn to inquire into or to determine facts, and to declare the truth according to the evidence legally deduced, and they are sworn judges upon evidence in matters of fact. In *English law*, when the object is inquiry only, the tribunal is sometimes called an inquest or inquisition; but when facts are to be determined by it for judicial purposes, it is always termed a jury. Trial by jury, in *popular language*, signifies the determination of facts in the administration of civil or criminal justice by twelve men, sworn to decide facts truly according to the evidence produced before them. The juries at present in use in England in the ordinary courts of justice are *grand juries*, *petty* or *common juries*, and *special juries*. Grand juries are exclusively incident to courts of criminal jurisdiction; their office is to examine into charges of crimes brought to them at assizes or sessions, and if satisfied that they are true, or at least that they deserve more particular examination, to return a bill of indictment against the accused, upon which he is afterward tried by the petty jury. A grand jury must consist of twelve at the least, but in practice a greater number usually serve, and twelve must always concur in finding every indictment. *Petty* or *common juries* consist of twelve men only. They are appointed to try all cases both civil and criminal, and to give their verdict according to the evidence adduced. The jury, after the proofs of a cause are summed up, unless the case be very clear, withdraw from the bar to consider of their verdict; and, in order to avoid intemperance and causeless delay, are kept without drink, fire, or candle, unless by permission of the judge, till they are all unanimously agreed. *Special juries* are used when the causes are of too great nicety for the discrimination of ordinary juries. Every person described in the juror's book as an esquire, or persons of higher degree, or as banker, or merchant, is qualified and liable to serve on special juries. The statute contains a multiplicity of enactments respecting the making out yearly lists of jurors, and their qualifications. —*Challenge of jurors.* [*See* CHALLENGE.] According to the *law of Scotland*, the number of the jury in criminal cases is fifteen; and the majority of that number determine what the verdict shall be. In civil cases, and in revenue cases before the court of exchequer the number of the jury is twelve; and the jury must be unanimously agreed in their verdict, according to the practice in England. In all cases of high treason the jury also consists of twelve, and their verdict must be unanimous, as in England. In *Scotland*, the distinction between grand and petty juries is not recognized.

JU'RYMAN, *n.* One who is impanneled on a jury, or who serves as a juror.

JU'RYMAST, *n.* A mast erected in a ship, to supply the place of one carried away in a tempest or an engagement, &c. The most probable origin of the word *jury*, in this compound, is that proposed by Thomson, viz., from the Fr. *jour*, day, quasi *jouré*, temporary, or from L. *juvare*, to assist.

It represents a close articulation, formed by pressing the root of the tongue against the upper part of the mouth, with a depression of the lower jaw and opening of the teeth. It is usually denominated a guttural, but is more properly a palatal. Before all the vowels, it has one invariable sound, corresponding with that of *c*, before *a*, *o* and *u*, as in *keel*, *ken*. In monosyllables, it is used after *c*, as in *crack*, *check*, *deck*, being necessary to exhibit a correct pronunciation in the derivatives, *cracked*, *checked*, *decked*, *cracking*, for without it, *c*, before the vowels *e* and *i*, would be sounded like *s*. Formerly, *k* was added to *c*, in certain words of Latin origin, as in *musick*, *publick*, *republick*. But in modern practice, *k* is very properly omitted, being entirely superfluous, and the more properly, as it is never written in the derivatives, *musical*, *publication*, *republican*. It was till lately retained in *traffick*, as in monosyllables, on account of the pronunciation of the derivatives, *trafficked*, *trafficking*, but we now write *traffic*. *K* is silent before *n*, as in *know*, *knife*, *knee*. As a numeral, K stands for 250; and with a stroke over it thus, K̄, for 250,000. As a contraction, K stands for *knight*, as K.B., Knight of the Bath; K.G., Knight of the Garter; K.C.B., Knight Commander of the Bath; K.T., Knight of the Thistle; and K.H., Knight of Hanover. This character was not used by the ancient Romans, and rarely in the later ages of their empire. In the place of *k*, they used *c*, as in *clino*, for the Greek κλινω. In the Teutonic dialects, this Greek letter is sometimes represented by *h*. [*See* H.]

KAN'TIAN PHILOSOPHY. A system of philosophy framed by Immanuel Kant, professor of logic and metaphysics in the university of Königsberg. It is also termed the critical philosophy. The great object of Kant was to ascertain the possibility and determine the limits of human knowledge, and to put an end to the sensualism of the French followers of Locke, the dogmatic rationalism of Wolf and Leibnitz, and the refined scepticism fostered by Hume's writings. The speculative part of our nature he divides into three great provinces,- sense, understanding, and reason. He held that the reason, as a pure faculty, must criticise, not only itself, but also, as the highest activity of the human intellect, the subordinate faculties of sense and understanding. All knowledge which has regard in general not so much to objects as to our mode of knowing or apprehending them, so far as this is conceived to be possible *à priori*, he terms *transcendental*. Time and space he calls forms of intuition, and shows that all our perceptions are submitted to these two forms. All the operations of the understanding he comprehends under four classes, called categories. 1. Quantity, including unity, multeity, totality; 2. Quality, divided into reality, negation, limitation; 3. Relation, viz., substance and accident, cause and effect, action and reaction; 4. Modality, subdivided into possibility, existence, and necessity. The highest faculty, the reason, consists in the power of forming ideas,—pure forms of intelligence, to which the sensible world has no adequate correspondents.

KNIGHT, *n.* (nite.) [Sax. *cniht, cneoht*, a boy, a servant, Ir. *cniocht*, G *knecht.*] 1. Originally, a knight was a youth, and young men being employed as servants, hence it came to signify a servant. But among our warlike ancestors, the word was particularly applied to a young man after he was admitted to the privilege of bearing arms. The admission to this privilege was a ceremony of great importance, and was the origin of the institution of knighthood. Hence, in feudal times, a *knight* was a man admitted to military rank by a certain ceremony. This privilege was conferred on youths of family and fortune, and hence sprung the honourable title of knight, in modern usage, which in dignity ranks next to nobility. Knighthood is the highest rank of a commoner, but a knight is still a commoner. A knight has the title of *Sir* before his Christian name, as, *Sir* John, *Sir* William. Anciently, when the Christian name was not known, the style was *Sir* Knight. [*See* KNIGHTHOOD.]—2. A pupil or follower.—3. KNIGHTHOOD, *n.* The character or dignity of a knight.—2. The order or fraternity of knights. The order of knighthood as now existing appears to have originated in the eleventh and twelfth centuries, and it was introduced into this country from France. It was a military institution, but there appears to have been something of a religious character belonging to it, and the order of knighthood, like the orders of the clergy, could be conferred only by persons who were themselves members of the order. In early times some knights undertook the protection of pilgrims; others were vowed to the defence or recovery of the holy sepulchre; others roved about as knights-errant, seeking adventures. It was common to create knights on various occasions. The most honourable species of knighthood was that conferred on the field, and after a battle; but the more common fashion, especially in France, was to make knights when a battle was expected. In the age of chivalry, the youth who aspired to the honour of knighthood, was first educated, in general, as a page attached to the family, and especially to the ladies of some noble house, during which period he was also trained to the use of arms, riding, &c. When properly qualified for arms he became an esquire, or squire, in which capacity he attended on some knight, and was his shield-bearer. The third, and highest rank of chivalry, was that of knighthood, which was not conferred before

the twenty-first year, except in the case of distinguished birth or great achievements. The candidate, when the order was conferred with full solemnity, had to go through various imposing preliminary ceremonies, and was then admitted with religious rites. Knighthood was conferred by the *accolade*, which, from the derivation of

Conferring Knighthood.

the name, should appear to have been originally an embrace, but afterwards consisted, ~~as it still does~~, in a blow of the flat of a sword on the neck of the kneeling candidate. The oath of knighthood was previously administered. Knighthood is now conferred in England by the king, (or queen when the throne is filled by a female,) by simple verbal declaration, attended with a slight form, without any patent or other written instrument. It gives to the party precedence over esquires and other untitled gentlemen. *Sir* is prefixed to the baptismal name of knights and baronets, and their wives have the legal designation of *Dame*, which is ordinarily converted into *Lady*. The chief distinction of rank which subsisted between knights in France and England, was that of *knights bachelors*, and *knights bannerets*. The knight bachelor was of the lower order, and obtained his honour without any reference to a qualification of property, and many of this rank were mere adventurers, who offered their services in war to any successful leader. The knight banneret was one who possessed fiefs to a considerable amount, and was obliged to serve in war with a greater attendance, and carried a banner. The orders of knighthood are of two classes; either they are associations, or fraternities, possessing property and rights of their own, as independent bodies, or they are merely honorary associations, established by sovereigns within their respective dominions. To the former class belonged the three celebrated religious orders founded during the Crusades—Templars, Hospitallers, and Teutonic Knights. The other class consisting of orders merely titular, embraces most of the existing European orders: such as the order of the Golden Fleece, the order of the Holy Ghost, the order of St. Michael. The three great British orders are the Garter, the Thistle, and St. Patrick. The Garter is the most ancient and illustrious of the three. It was founded by Edward the Third. The knights, twenty-five in number, are the most eminent persons of the English nation, together with many illustrious foreigners, chiefly sovereign princes. The order of the Thistle was instituted in 1540, by James the Fifth of Scotland. The number of knights is sixteen, all of whom are nobility of Scotland. The order of St. Patrick was instituted in 1783. The number of knights is twenty-two, who are peers of Ireland. The order of the Bath differs in some respects from those spoken of. It is now composed of three classes, military and civil knights, grand crosses, knights commanders, and knights companions. All these orders have particular badges. There are also knights of the Guelphic order, knights of the Ionian order, of St. Michael and St. George.

L

L, the twelfth letter of the English Alphabet, is usually denominated a *semi-vowel*, or a *liquid*. It represents an imperfect articulation, formed by placing the tip of the tongue against the gum that incloses the roots of the upper teeth; but the sides of the tongue not being in close contact with the roof of the mouth, the breath of course not being entirely intercepted, this articulation is attended with an imperfect sound. The shape of the letter is evidently borrowed from that of the Oriental *lamed*, or *lomad*, nearly coinciding with the Samaritan ℒ. L has only one sound in English, as in *like*, *canal*. At the end of monosyllables, it is often doubled, as in *fall*, *full*, *tell*, *bell*; but not after diphthongs and digraphs; *foul*, *fool*, *prowl*, *growl*, *foal*, &c., being written with a single *l*. With some nations, *l* and *r* are commutable; as in Gr. λείριον, L. *lilium*; It. *scorta*, an escort, Sp. and Port. *escolta*. Indeed *l* and *r* are letters of the same organ. By some nations of Celtic origin, *l* at the beginning of words is aspirated and doubled in writing, as in the W. *lled*, L. *latus*; *llan*, a *lawn*; *llawr*, a *floor*; Sp. *llamar*, L. *clamo*. In some words *l* is mute, as in *half*, *calf*, *walk*, *talk*, *chalk*. In our mother tongue, the Anglo-Saxon, *l* is sometimes preceded by *h*, and aspirated, as in *hlaf*, loaf; *hladan*, to lade or load; *hlot*, lot; *hlinian*, *hleonian*, to learn, Gr. κλίνω, L. *clino*. In the latter word the Saxon *h* represents the Greek κ and Latin *c*, as it does in many other words. In English words, the terminating syllable *le* is unaccented, the *e* is silent, and *l* has a feeble sound; as, in *able*, *eagle*, pronounced *abl*, *eagl*. As a numeral, L denotes 50, and with a dash, L̄, 50,000. As an abbreviation, in Latin, it stands for Lucius; L. L. S. for a sesterce, or two *libræ* and a half. LL.D., *Legum Doctor*, Doctor of Laws. *L.* also often stands for *libra*, a pound in money, and *lb.* for a pound in weight. It is also often used for *Liber*, book, or division in a work.

LA, *exclam.* [perhaps corrupted from *look*, but this is doubtful.] Look; see; behold. It is obsolete, except as a vulgarism.

LA, in *music*, the syllable by which Guido denotes the last sound of each hexachord. If the hexachord begins in C, the *la* answers to our A; if in G, to our E, and if in F, to D.

The word is sometimes used for any other standard or flag.

The final *d* is probably adventitious. The primary sense is a lay or spread.] 1. Earth, or the solid matter which constitutes the fixed part of the surface of the globe, in distinction from the sea or other waters, which constitute the fluid or movable part. LAND'-BREEZE, *n.* [*land* and *breeze*.] A current of air setting from the land toward the sea. -*Land and sea-breeze* prevail on the coasts, particularly in tropical countries, though they are not confined to any particular latitude. During the day the surface of the land becomes more heated than that of the adjacent ocean, and the air over the land, in consequence of its greater rarefaction, is displaced by the denser air rushing in from the sea. Hence a current, or *sea-breeze*, beginning at some hour in the morning, and continuing till near sun-setting, will flow from the sea toward the land. At night the water remains warm, while the surface of the land cools rapidly, and hence the current sets from the land towards the water, and forms the *land-breeze*. Winds of this sort are more frequent about islands and small peninsulas, than in other situations.

LAND'MEASURING, *n*. The art of determining by measurement and computation the superficial contents of portions of lands in acres, roods, &c., as fields, farms, &c. It is properly a subordinate branch of *land surveying*, but the terms are sometimes used synonymously. Land is measured by Gunter's chain, which consists of 100 links, each 7.92 inches; consequently the whole length of the chain is 66 feet; 10 square chains, or 100,000 square links make an acre. [*See* ACRE.] Besides the chain, certain other subordinate instruments are necessary, as small arrows to stick into the ground at the end of every chain, a few poles, a measuring tape divided into links, a cross staff, or rather an optical square, for taking perpendiculars. For measuring angles, the best instrument is the theodolite. The fields or lands to be measured are divided into triangles, and as many parts of each triangle are measured as furnish sufficient data for calculation. An outline of the field, together with the various triangles, is laid down upon paper, and also the lengths of the several lines, and the magnitude of the angles measured, must be noted down. This is termed *plotting*, and prepares the measurer for calculating the superficial contents. In measuring hilly ground, it is usual to reduce the surface to the horizontal plane.

LAND'SURVEYING, *n*. The art of determining the boundaries and superficial extent of portions of land, as estates, or parts of an estate, by the aid of proper instruments. It consists of three distinct operations: 1. The measuring of certain lines and angles necessary as data for calculation. 2. The laying down of the same upon paper, so as to form a correct map of the whole. 3. The computation of the superficial contents from the lines and angles laid down. All the lines and the surfaces whose contents are to be found, are reduced to the same horizontal plane. The instruments employed by the landsurveyor are the same as those mentioned under landmeasuring. For the purposes of sketching and filling in the details of a map, the plane table and prismatic compass are used; also, in order to determine the bearings of the several objects observed from any station, with reference to the cardinal points of the horizon, a compass and needle accompany the theodolite. As every plane figure may be regarded as composed of a certain number of triangles, the whole theory of land surveying resolves itself into the measurement of the areas of plane triangles. [*See* SURVEYING.]

It is a landlord's tax payable by the tenant, who may deduct it from the rent of the current year, otherwise it cannot be recovered back from the landlord at any future time. The land-tax of Scotland, or cess, is a permanent tax fixed at L.47,954 *per annum*, to be levied out of the land rent of Scotland for ever, subject however, as in England, to a power of redemption. Human speech; the expression of ideas by words or significant articulate sounds, for the communication of thoughts. *Language* consists in the oral utterance of sounds, which usage has made the representatives of ideas. When two or more persons customarily annex the same sounds to the same ideas, the expression of these sounds by one person communicates his ideas to another. This is the primary sense of *language*, the use of which is to communicate the thoughts of one person to another through the organs of hearing. Articulate sounds are represented by letters, marks, or characters which form words. Hence language consists also in 2. Words duly arranged in sentences, written, printed, or engraved, and exhibited to the eye.—3. The speech or expression of ideas peculiar to a particular nation. Men had originally one and the same *language*, but the tribes or families of men, since their dispersion, have distinct *languages*. This class is limited to the Shemitic languages, including the Aramean, the Hebrew, and Arabic. The Indo-Germanic languages are divided into—1. The Indian branch, comprising the Sanscrit, and its derivatives. 2. The Medo-Persic or Arian branch, at the head of which stands the Zend. 3. The Græco-Latin branch, comprising the two ancient classical languages. 5. The Slavonic branch, including the Lithuanian, the ancient Prussian, the Russian, the Polish, and Bohemian. 6. 2. *Municipal law,* is a rule of civil con-

duct prescribed by the supreme power of a state, commanding what its subjects are to do, and prohibiting what they are to forbear; a statute. Municipal or civil laws are established by the decrees, edicts, or ordinances of absolute princes, as emperors and kings, or by the formal acts of the legislatures of free states. *Law* therefore is sometimes equivalent to *decree, edict*, or *ordinance*.—*Municipal law* is divided with reference to the legal consequences of a breach of legal duty into *civil* and *criminal*. *Civil law* is that department of law in which every breach of a duty may be made the subject of a legal proceeding, for the purpose of conferring on the person wronged a right from the enjoyment of which he is excluded by the defendant, or of obtaining from the defendant compensation for a right violated by him. *Criminal law* is that department of law in which every breach of duty may be made the subject of a legal proceeding, instituted by the sovereign or his representatives, for the purpose of inflicting punishment on the person charged with the breach of duty. [*See* CIVIL and CRIMINAL.]—3. *Law of nature*, is a rule of conduct arising out of the natural relations of human beings established by the Creator, and existing prior to any positive precept. Thus it is a *law of nature*, that one man should not injure another, and murder and fraud would be crimes independent of any prohibition from a supreme power.—4. *Laws of animal nature*, the inherent principles by which the economy and functions of animal bodies are performed, such as respiration, the circulation of the blood, digestion, nutrition, various secretions, &c.—5. *Laws of vegetation*, the principles by which plants are produced, and their growth carried on till they arrive to perfection.—6. *Physical laws*, or *laws of nature*. The invariable tendency or determination of any species of matter to a particular form with definite properties, and the determination of a body to certain motions, changes, and relations, which uniformly take place in the same circumstances, is called a *physical law;* as the *laws* of chemical affinity; the *laws* of gravitation; the *laws* of motion. [*See* AFFINITY, ATTRACTION, GRAVITATION, MOTION.] These tendencies or determinations, whether called laws or affections of matter, have been established by the Creator, and are, with a peculiar felicity of expression, denominated in Scripture, *ordinances of heaven*.—7. *Laws of nations*, the rules that regulate the mutual intercourse of nations or states. These rules depend on natural law, or the principles of justice which spring from the social state; or they are founded on customs, compacts, treaties, leagues, and agreements between independent communities.

By the *law of nations*, we are to understand that code of public instruction, which defines the rights and prescribes the duties of nations, in their intercourse with each other. *Kent.*

8. *Moral law*, a law which prescribes to men their religious and social duties, in other words, their duties to God and to each other. The moral law is summarily contained in the decalogue or ten commandments, written by the finger of God on two tables of stone, and delivered to Moses on mount Sinai; Ex. xx.—9. *Ecclesiastical law*, a rule of action prescribed for the government of a church; otherwise called *canon law*.—10. *Written law*, a law or rule of action prescribed or enacted by a sovereign or legislature, and promulgated and recorded in writing; a written statute, ordinance, edict, or decree.—11. *Unwritten* or *common law*, a rule of action which derives its authority from long usage, or established custom, which has been immemorially received and recognized by judicial tribunals. As this law can be traced to no positive statutes, its rules or principles are to be found only in the records of courts, and in the reports of judicial decisions.—12. *By-law*, a law of a city, town, or private corporation. [*See* BY.]—13. *Mosaic law*, the institutions of Moses, or the code of laws prescribed to the Jews, as distinguished from the *Gospel*.—14. *Ceremonial law*, the Mosaic institutions which prescribe the external rites and ceremonies to be observed by the Jews, as distinct from the *moral precepts*, which are of perpetual obligation.—15. It is properly the putting under the cognizance of courts martial a great variety of subjects which, by ordinary military law, do not appertain to them to be tried in a summary way. Where martial law is proclaimed, all military persons, under all circumstances, are placed within its jurisdiction. It extends, also, to a variety of cases not relating to the discipline of the army and offences committed by non-military persons, as plots against the sovereign, intelligence to the enemy, &c. *Military law*, properly, that law which is administered by courts martial, under the authority of parliament, and the mutiny act, annually passed, together with the articles of war.—22. *Marine laws*, rules for the regulation of navigation, and the commercial intercourse of nations.—23. *Commercial law, law-merchant*, the system of rules by which trade and commercial intercourse are regulated between merchants.—24. Hence the phrase, *to go to law*, to prosecute; to seek redress in a legal tribunal.—25. Jurisprudence; as in the title, *Doctor of Laws*.—26. In general, *law* is a rule of action prescribed for the government of rational beings or moral agents, to which rule they are bound to yield obedience, in default of which they are exposed to punishment; or *law* is a certain inherent instinctive propension of irrational animals to particular actions; or an invariable determination or tendency of inanimate bodies to certain motions, combinations, and forms. *Law* is not a series of actions, but the cause or principle from which they proceed, and of which they are the evidence. The *law* of England is divided into the *lex non scripta*, the unwritten or common law, and the *lex scripta*, the written or statute law. [*See* Nos. 10, 11.] The unwritten law is so called, not because it does not exist in writing, but because it was not promulgated by the legislature in a written form. It derives its force from long established usage and universal reception, and includes general customs, or the common law, properly so called; particular customs belonging to certain parts of the kingdom, particular laws observed by custom only in certain courts and jurisdictions, and the greater part of the law styled equity. *Written law* comprehends the statutes made by the parliament or supreme legislature, and the written regulations issued by subordinate legislatures; as, orders in council, and rules of court made by the judges. The law of Scotland is divided similarly to that of England.—*Laws of honour*. [*See* HONOUR.]—*Law language*, the language used in legal writings and forms, particularly the Norman dialect or Old French, which was used in judicial proceedings from the days of William the Conqueror to the 36th year of Edward III.—*Wager of law*, a species of trial formerly used in England, in which the defendant gave security that he would, on a certain day, make his law, that is, he would make oath that he owed nothing to the plaintiff, and would produce eleven of his neighbours as compurgators, who should swear that they believed in their consciences that he had sworn the truth.

means of support, the greater part of them living day and night in the streets and public places, and earning a scanty subsistence by employing themselves as messengers, porters, and occasional servants. A metal of a bluish-grey colour, and when recently cut it has a strong metallic lustre; but soon tarnishes by exposure to the air, acquiring a superficial coating of carbonate of protoxide of lead. Its specific gravity is 11.381. It is soft, flexible, and inelastic. It is both malleable and ductile, possessing the former property to a considerable extent, but in tenacity it is inferior to all ductile metals. It fuses at about 612°, and when slowly cooled forms octohedral crystals. There are four oxides of lead: -1. The suboxide, of a greyish-blue colour. 2. The protoxide or yellow oxide, called also *massicot.* Litharge is this oxide in the form of small spangles from having undergone fusion. 3. The plumbeous suroxide of Berzelius, the well-known pigment called *red lead* or *minium.* 4. The peroxide, obtained by putting red lead in chlorine water, or in dilute nitric acid. The protoxide of lead is the base of all the salts of lead; of these the carbonate or *white lead*, and the acetate, are the most important. The protoxide is also employed for glazing earthen ware and porcelain. The carbonate of lead is the basis of white oil paint, and of a number of other colours. Sugar of lead is a solution of the acetate in cold water. The extract of lead is a subacetate and is used as a test and precipitant. The salts of lead are poisonous, but the carbonate is by far the most virulent poison. The lead of commerce, which commonly contains silver, iron, and copper, is extracted from the native sulphuret, the *galena* of mineralogists. The other ores of importance are the *seleniuret, native minium, plomb gomme, white lead, vitreous lead, phosphate of lead, muriate* or *horn lead, arseniate of lead.* No country in the world produces so much lead as Great Britain. The total product of the United Kingdom has been estimated at from 45,000 to 50,000 tons; of which amount from 16,000 to 20,000 tons are exported. Lead unites with most of the other metals. It is run from the furnace into moulds, which are technically called "*pigs*," from which it is formed into sheets, pipes, &c. Sheet lead is of two kinds; *cast*, and *milled* or rolled. It is used in covering large buildings, in flats or slopes, for gutters, the hips, ridges, and valleys of roofs, the lining of cisterns, &c. Lead is also extensively used in the manufacture of shot, in making pipes for conveying water, gas, &c.—2. A plummet or mass of lead, used in sounding at sea. The common hand lead weighs eleven pounds, with about twenty fathoms of line. The line is marked at 5, 7, 10, 13, 17, and 20 fathoms. When the depth is great the deep-sea line of twenty-eight pounds is used.—*To heave the lead*, to throw it into the sea in a manner calculated to produce the desired effect.—3. *Leads*, a flat roof covered with lead.—*White lead*, the oxide of lead, ground with one-third part of chalk.—*Black lead*, plumbago,—*which see.*

LESS, for UNLESS.†

LESS, a terminating syllable of many nouns and some adjectives, is the Sax. *leas*, Goth. *laus*, belonging to the verb *lysan*, *lausyan*, to loose, free, separate. Hence it is a privative word, denoting destitution; as, a *witless* man, a man destitute of wit; *childless*, without children; *fatherless*; *faithless*; *penny-less*; *lawless*, &c.

> Ye shall not eat of it, neither shall ye touch it, *lest* ye die; Gen. iii.

But in the four latter dialects, there is another verb, which corresponds with *let* in some of its significations; D. *lyden*, G. *leiden*, Sw. *lida*, Dan. *lider*, to suffer, endure, undergo, to permit. With this verb corresponds the English *late*, D. *laat*, Sw. *lat*, Dan. *lad*, slothful, lazy; and the G. *lass*, feeble, lazy, coincides with *lassen*, supra, and this may be the Eng. *lazy*. To *let out*, like L. *elocare*, is to *lease*, Fr. *laisser*. *Let* is the Fr. *laisser*, in a different dialect. By the German and Welsh it appears that the last radical may have originally been *th*, *ts*, or *tz*, or other compound.] 1. To permit; to allow; to suffer; to give leave or power by a positive act, or negatively, to withhold restraint; not to prevent. Followed by the first and third persons, it expresses desire or wish; hence it is used in prayer and entreaty to superiors, and to those who have us in their power; as, *let* me not wander from thy commandments; Ps. cxix. Followed by the first person plural, *let* expresses exhortation, or entreaty; as, rise, *let us* go. Followed by the third person, it implies permission or command, addressed to an inferior. *Let him* go, *let them* remain, are commands addressed to the second person. *Let thou*, or *let ye*, that is, do thou, or you, permit him to go. Sometimes *let* is used to express a command or injunction to a third person. When the signal is given to engage, *let* every man do his duty. When applied to things not rational, it implies allowance or concession

4. The line of direction in which a missile weapon is aimed.—5. An instrument by which to find or draw a straight line parallel to the plane of the horizon, and by this means to determine the true level or the difference of ascent or descent between several places, for various purposes in architecture, agriculture, engineering, hydraulics, surveying, &c. There is a great variety of instruments for this purpose, differently constructed and of different materials, according to the particular purposes to which they are applied; as, the carpenter's level, mason's level, gunner's level, balance level, water level, mercurial level, spirit level, surveying level, &c. All such instruments, however, may be reduced to three classes:—1. Those in which the vertical line is determined by a suspended plumb line or balance weight, and the horizontal indicated by a line perpendicular to it. Such are the carpenter's and mason's levels. 2. Those which determine a horizontal line by the surface of a fluid at rest; as water, and mercurial levels. 3. Those which point out the direction of a horizontal line by a bubble of air floating in a fluid contained in a glass tube. Such are spirit levels, which are by far the most convenient and accurate. All levels depend on the same principle, namely, the action of terrestrial gravity.—6. Rule; plan; scheme; borrowed from the mechanic's level.

LEV'ELLING, *n.* The art or practice of finding a horizontal line, or of ascertaining the different elevations of objects on the surface of the earth; in other words, the art or practice of finding how much any assigned point is higher than another assigned point above a level surface, or such a surface as water would assume when perfectly at rest. It is a branch of surveying, of great importance in making roads, determining the proper lines for railways, conducting water, draining low grounds, rendering rivers navigable, forming canals, and the like. In ordinary cases of levelling (for example, for canals, rail-ways, &c.) the instruments commonly employed are a spirit level attached to a telescope, and a pair of levelling staves. In extensive surveys allowance must be made for the curvature of the earth.

LEVELLING STAVES. Instruments used with the spirit level in levelling, serving to support the marks to be observed, and, at the same time, to measure the heights of those marks from the ground. They are also called *levelling poles*, *station poles*, or *station staves*.

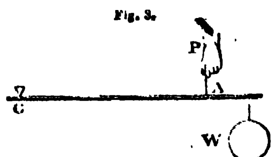
Its arms are equal, as in the *balance*; or unequal, as in *steelyards*. It is one of the mechanical powers, and is of three kinds, viz., 1. When the fulcrum is between the weight and the power, as in the



handspike, crowbar, &c. 2. When the weight is between the power and the fulcrum, as in *rowing a boat*. 3. When the power is between the weight and the fulcrum, as in *raising a ladder* from the ground, by applying the hands to one of the lower rounds. The bones of animals are levers of the third kind Fig. 1. represents a lever of the first

kind, the power acting at A, the weight or resistance at W, C being the fulcrum or prop. Fig. 2. is a lever of the

second kind, fig. 3. a lever of the third kind. In all levers the power and

weight are inversely proportional to the perpendicular lines drawn from the fulcrum to the directions in which the two forces act. The lever is the most simple of the mechanic powers, and is extensively used in the construction of almost every mechanical contrivance; indeed, in one or other of its forms no machine is entirely without it; in its most simple form it is used for raising heavy weights to small heights.—*Compound lever*, a machine consisting of several simple levers combined together, and acting perpendicularly on each other. As the electric fluid passes to the inside of the jar, an equal quantity passes from the outside, so that the two sides are brought into opposite states, the inside being positive and the outside negative. The jar is discharged by establishing a communication between the outside coating and the knob. This jar is said to have been first contrived at Leyden, and hence the name. Any book, pamphlet, writing, or picture, containing representations, maliciously made or published, tending to bring a person into contempt, or expose him to public hatred and derision. The communication of such defamatory writing to a single person, is considered in law a publication. It is immaterial with respect to the essence of a libel, whether the matter of it is true or false, since the provocation and not the falsity is the thing to be punished *criminally.* But in a *civil* action, a libel must appear to be false, as well as scandalous. In a more extensive sense, any blasphemous, treasonable, or immoral writing or picture made public, is a libel, and punishable by law. *Libel*, in the *law of Scotland*, is used in different significations; it is applied to the form of the complaint, or the ground of the charge on which either a civil or criminal prosecution takes place. It is also applied to scandal reduced into writing.—2. LIB'ERTY, *n.* [L. *libertas*, from *liber*, free; Fr. *liberté*.] 1. Freedom from restraint, in a general sense, and applicable to the body, or to the will or mind The body is at *liberty*, when not confined; the will or mind is at *liberty*, when not checked or controlled. A man enjoys *liberty*, when no physical force operates to restrain his actions or volitions.—2. *Natural liberty*, consists in the power of acting as one thinks fit, without any restraint or control, except from the laws of nature. It is a state of exemption from the control of others, and from positive laws and the institutions of social life. This liberty is abridged by the establishment of government.—3. *Civil liberty*, is the liberty of men in a state of society, or natural liberty, so far only abridged and restrained, as is necessary and expedient for the safety and interest of the society, state, or nation. A restraint of natural liberty, not necessary or expedient for the public, is tyranny or oppression. Civil liberty is an exemption from the arbitrary will of others, which exemption is secured by established laws, which restrain every man from injuring or controlling another. Hence the restraints of law are essential to *civil liberty*.

The *liberty* of one depends not so much on the removal of all restraint from him, as on the due restraint upon the *liberty* of others. *Ames.*

In this sentence, the latter word *liberty* denotes *natural liberty*.—4 *Political liberty*, is sometimes used as synonymous with *civil liberty* But it more properly designates the *liberty of a nation*, the freedom of a nation or state from all unjust abridgment of its rights and independence by another nation. LIBRA'TION, *n.* The act of balancing or state of being balanced; a state of equipoise, with equal weights on both sides of a centre.—2 In *astr.*, an apparent irregularity of the moon's motion, whereby those parts very near the border of the lunar disc alternately disappear and become visible, making stated periodical oscillations, and indicating, as it were, a sort of vibratory motion of the lunar globe. The *libration* of the moon is of three kinds, her *libration in longitude*, or a seeming vibratory motion according to the order of the signs; owing to this circumstance, that the motion of the moon about her axis is not always precisely equal to the angular velocity in her orbit; her *libration in latitude*, in consequence of her axis being inclined to the plane of her orbit, so that sometimes one of her poles, and sometimes the other declines as it were, or dips towards the earth. The third kind is the *diurnal libration*, which is simply a consequence of the lunar parallax. An observer at the surface of the earth perceives points near the upper edge of the moon's disc, at the time of her rising, which disappear as her elevation is increased; while new ones on the opposite or lower edge, that were before invisible, come into view as she descends towards the horizon. If the observer were placed at the earth's centre he would perceive no diurnal vibration.—*Libration of the earth*, a term applied by some astronomers to that motion by which the earth is so retained within its orbit, that its axis continues parallel to the axis of the world.—3. A balancing or equipoise between extremes.

LIGHT, *n.* (lite.) This word furnishes a full and distinct explanation of the original sense of light, to throw, dart, shoot, or break forth; and it accords with Eng. *luck*, both in elements and radical sense.] 1. That imponderable ethereal agent or matter which makes objects perceptible to the sense of seeing, but the particles of which are separately invisible. It has been believed that light is a fluid or real matter, existing independent of other substances, with properties peculiar to itself. Its velocity is astonishing, as it passes through a space of nearly twelve millions of miles in a minute. Light, when decomposed, is found to consist of rays differently coloured; as, red, orange, yellow, green, blue, indigo, and violet. The sun is the principal source of light in the solar system; but light is also emitted from bodies ignited, or in combustion, and is reflected from enlightened bodies, as the moon. Light is also emitted from certain putrefying substances. It is usually united with heat, but it exists also independent of it. The intensity of light, at different distances from a luminous body, is inversely as the squares of those distances, so that in this respect it follows the same law as heat, sound, and the force of gravity. Light acts a very important part in the vegetable economy. The green colour of plants and the hues of flowers entirely depend upon it. It is also found to assist in developing the forms of some of the lower classes of animals. There are two theories respecting the nature of light. Some maintain that it is composed of material particles, which are constantly thrown off from the luminous body; while others suppose that it is a fluid, diffused through all nature, and that the luminous body occasions waves or undulations in this fluid, by which the light is propagated in the same manner as sound is conveyed through the air. The first is called the *corpuscular*, the second the *undulatory theory;* the latter is now more generally entertained, several facts being wholly inexplicable on the former theory. The language, however, which is employed in treating of light is, for the most part, accommodated to the former. Light proceeds in straight lines while passing through the same medium, but when it enters a medium of different density, it is bent or refracted. [*See* REFRACTION.] It is also reflected from polished surfaces, making the angle of reflection equal to that of incidence. [*See* REFLECTION.]—2. The metallic base of lime is *calcium,—which see.* Lime is the protoxide of calcium. When it is required of great purity, it is prepared from pure carbonate of lime, such as Iceland spar, or Carrara marble. It is a brittle, white, earthy solid, the specific gravity of which is about 2.3. It phosphoresces powerfully when heated to full redness. It is one of the most infusible bodies known. It has a powerful affinity for water, and when water is sprinkled upon it, it becomes very hot, and crumbles down into a dry powder, called *slaked lime*, or *hydrate of lime.* The carbonate of lime is a most abundant natural product, and is found pure in the varieties of calcareous spar, and statuary marble. Chalk and several varieties of limestone are also nearly pure carbonates of lime. The salts of lime, as the nitrate, sulphate, phosphate, oxalate, &c., several of which exist native, are generally obtained by dissolving carbonate of lime in the respective acids. Chloride of lime, or bleaching powder, is obtained by exposing hydrate of lime to chlorine, and when this is dissolved in water it forms bleaching liquid. The most important application of lime is in the manufacture of mortar and other cements used in building; it is also extensively used as a manure to fertilize land.—3 In *bot.*, a species of citrus, the citrus *limetta.* [*See* CITRUS.] Also the name given to several species of *Tilia*, belonging to the nat. order Tiliaceæ. The American lime-tree (*T. Americana*) resembles the European. Besides the European, two other species are found in this country, *T. grandifolia*, or broad-leaved lime, and *T. parvifolia*, or small-leaved lime, which grows wild.—4 [Fr. *lime. The principal of these are foliated limestone, comprehending calcareous spar and the different kinds of marble; compact limestone; chalk, fibrous limestone; tufaceous limestone or calc tuff, marl, bituminous marl-slate All limestones may be scraped with a knife; they are infusible, and effervesce when a drop of strong acid is applied on the surface. Sennefelder at Munich, in Bavaria. The principles upon which this art is founded, are—1. The quality which a compact granular limestone has of imbibing grease or moisture: and 2. The decided antipathy of grease and water for each other. A drawing being made upon the stone with an ink or crayon of a greasy composition, is washed over with water, which sinks into all the parts of the stone not defended by the drawing. A cylindrical roller, charged with printing ink, is then passed all over the stone, and the drawing receives the ink, whilst the water defends the other parts of the stone from it on account of its greasy nature. Impressions of the drawing may then be taken upon paper, by means of a lithographic press. The most convenient and useful way, however, of proceeding, is to write with proper ink on a prepared paper, and then transfer the writing to the stone by passing it through the press.

The primary sense is to shut, to close, to press, strain, or drive, which may be the radical sense of *flock*, Gr. πλεκω, πλοκος, L. *plico*, as well as of *lock.*] 1. Lock, in its primary sense, is any thing that fastens; but we now appropriate the word to an instrument composed of springs, wards, and bolts of iron or steel, used to fasten doors, drawers, chests, &c. A good lock is the masterpiece in smithery, and requires much art and delicacy in contriving and varying the wards, springs, bolts, and other parts of which it is composed, so as to adjust them to places where they are serviceable, and to the various occasions of their use. The great desideratum is to construct a lock, so that it may not be opened by any key but its own, nor admit of being picked. Locks on outer doors are called *stock locks;* those on chamber doors, *spring locks;* and such as are hidden in the thickness of the doors to which they are applied, are called *mortise locks.* The most perfect locks are those constructed by Bramah, Chubb, Taylor, &c.—2. The barrier or works of a canal, which confine the water, consisting of a dam, banks or walls, with two gates or pairs of gates, which may be opened or shut at pleasure. By means of such locks vessels are transferred from a higher to a lower level, or from a lower to a higher. Whenever a canal changes its level on account of an ascent or descent of the ground through which it passes, the place where the change takes place is commanded by a lock.—4. A grapple or wrestling.—5. Any inclosure.—6. A tuft of hair; a plexus of wool, hay, or other like substance; a flock; a ringlet of hair.

LOCOFO'CO, *n.* [probably from L. *loco foci*, instead of a fire.] The American name of a friction-match. This term was sportively applied, in 1834, to the extreme portion of the democratic party, because, at a meeting in Tammany Hall, New York city, in which there was a great diversity of sentiment, the chairman left his seat, and the lights were extinguished, with a view to dissolve the meeting; when those who were in favour of extreme measures produced *loco-foco* matches, rekindled the lights, continued the meeting, and accomplished their immediate object. Hence, the American radicals are called *loco-focos*, or the *loco-foco* party.

LOCOMO'TION, *n.* [L. *locus*, place, and *motio*, motion.] 1. The act of moving from place to place.—2. The power of moving from place to place. Most animals possess *locomotion*; plants have life but not *locomotion*. *Locomotion* implies a motion which is attended by change of place in the moving body, in contradistinction to motions which a body may have which is stationary. A clock, a mill, a lathe, a steam-engine, fixed in its position, have all motion, but such motion is not *locomotion*.

Most animals are distinguished from plants by their *locomotive* faculty.—*Locomotive engine*, any engine, which being employed to draw loads from one place to another, travels with the load which it draws; but since the improvement and extension of railways, the term has been exclusively applied to the steam-engines by which loads are drawn upon railways. A steam-engine employed to propel a ship, though in reality a locomotive engine, is usually called a *marine engine*.—*Locomotive power*, any kind of moving power, but especially steam, applied to the transport of loads on land, which accompanies the load which it draws. [*See* RAILWAY.]

LO'CUS, *n.* [L. a place.] In *geom.*, a line by which a local or indeterminate problem is solved. A *locus* is a line, any point of which may equally solve an indeterminate problem. Thus if a right line suffice for the construction of the equation, it is called *locus ad rectum*; if a circle, *locus ad circulum*; if a parabola, *locus ad parabolam*; if an ellipse, *locus ad ellipsin*, and so on for the rest of the conic sections.—*Locus delicti*, a term in Scots law signifying the place where an offence is committed.—*Locus pœnitentiæ*, time of repentance before a probative writing is executed.—*Locus sigilli*, indicating *the place of the seal*, usually appended, with a party's signature, to a public document. To use the expressive language of holy writ, "The [devoted] land is as the garden of Eden before them, and behind them a desolate wilderness;" Joel ii. 3. The soil they have bared, often becomes infected with their dead carcases; yet the latter are eaten (dried, or preserved in brine) in some parts of N. LOG, *n.* [This word is probably allied to D. *log, logge*, heavy, dull, sluggish; a sense retained in *water-logged;* and to *lug, luggage*, perhaps to *clog.*] 1. A bulky piece or stick of timber unhewed. A piece of timber when hewed and squared, is not called a *log*, unless perhaps in constructing log-huts.—2. In *navigation*, a machine for measuring the rate of a ship's velocity through the water. The common *log* is a piece of board, forming the quadrant of a circle of about six inches radius, balanced by a small plate of lead nailed on the circular part, so as to swim perpendicularly in the water, with about two-thirds immersed under the surface. One end of a line, called the *log-line*, is fastened to the log, while the other is wound round a reel in the gallery of the ship. When at any time the log is thrown out of the ship while sailing, as soon as it touches the water it ceases to partake of the ship's motion, so that the ship goes on and leaves it behind, while the line is unwound from the reel, and the length of line unwound in a given time gives the rate of the ship's sailing. This is calculated by knots made on the line at certain distances, while the time is measured by a sand-glass of a certain number of seconds. The length between the knots is so proportioned to the time of the glass, that the number of knots unwound while the glass runs down, shows the number of miles the ship is sailing per hour. Thus, if the glass be a half-minute one, it will run down 120 times in an hour. Now, since a nautical mile contains about 6076 feet, the 120th part of this is about 50⅝ feet; so that if the spaces between the knots be 50⅝ feet, the number of knots and parts of a knot unwound from the reel in half a minute, is the number of miles and parts of a mile the ship runs in one hour. The part of the line between the log and the first knot, (about 5 fathoms,) is called the stray-line.—3. [Heb. לֹג, *log.*] A Hebrew measure of liquids, containing, according to some authors, three quarters of a pint; according to others, five-sixths of a pint. According to Arbuthnot, it was the seventy-second part of the bath or ephah, and the twelfth part of a hin.

LOG'ARITHM, *n.* [Fr. *logarithme;* Gr. λογος, ratio, and αριθμος, number.] Logarithms are the exponents of a series of powers and roots. The logarithm of a number is the exponent of the power to which another given invariable number must be raised in order to produce the first number. Thus, in the common system of logarithms, in which the invariable number is 10, the logarithm of 1000 is 3, because 10 raised to the third power is 1000. In general, if $a^x = y$, in which equation a is a given invariable number, then x is the logarithm of y. The invariable number is called the base of the system of logarithms. When the logarithms form a series in arithmetical progression, the corresponding natural numbers form a series in geometrical progression. Thus in the common system,

Logarithms,	0	1	2	3	4	5
Natural numbers,	1	10	100	1000	10000	100000

Hence the logarithm of 1 is 0; the log-

arithm of 10 is 1; of 100, 2; of 1000, 3; and so on. The logarithms of numbers between 1 and 10 will consist of a decimal, those of numbers between 10 and 100 will consist of the integer 1 with some decimal, those of numbers between 100 and 1000 will consist of the integer 2 with some decimal, and so on. The integral part of a logarithm is called its index, and the number of units in the index is always less by 1 than the number of integer places in the number corresponding, or the number of integer places in any given number is always 1 more than the number of units in the index of its logarithm. Thus, the index of the logarithm of 5 is 0; of 25, 1; of 225, 2; and so on. The logarithms of decimals have negative indices. Thus, the index of the logarithm of .5 is —1; of .05, —2; of 005, —3; and so on, the number of units in the index being always 1 greater than the number of ciphers immediately following the decimal point. The logarithms of numbers, from 1 generally up to 10,000, are formed into tables. They are of great importance in facilitating the arithmetical operations of multiplication and division, involution and evolution; for the addition and subtraction of logarithms answer to the multiplication and division of their natural numbers. In like manner, involution is performed by multiplying the logarithm of any number by the number denoting the required power; and evolution, by dividing the logarithm by the number denoting the required root. Logarithms are also of great value in trigonometrical and astronomical calculations; but for such calculations, tables are required, in addition to those already mentioned, containing the logarithms of the sines, co-sines, tangents, co-tangents, secants, and co-secants, for every minute of the quadrant.—*Arithmetical complement of a logarithm*, the difference between the logarithm and 10,000,000. Logarithms were invented about 1614, by John Napier, of Merchiston, in Scotland; but the kind now in use were invented by Henry Briggs, professor of geometry in Gresham college, at Oxford.—*Hyperbolic logarithms*, those computed by the inventor Napier, and so called, because they are analogous to the areas of a right-angled hyperbola, between the asymptotes and the curve. They have 1 for their modulus.

LOGARITHMET'IC, LOGARITHMET'ICAL, LOGARITH'MIC, *a.* Pertaining to logarithms; consisting of logarithms.—*Logarithmic* or *logistic curves*, a curve so called from its properties and uses in explaining and constructing logarithms, because its ordinates are in geometrical progression, while the abscissas are in arithmetical progression; so that the abscissas are as the logarithms of the corresponding ordinates. —*Logarithmic spiral* or *logistic spiral*, a curve line somewhat analogous to the common logarithmic. It intersects all its radiants at the same angle, and this angle is the modulus of the system of logarithms which the particular spiral represents. Also, its involute and evolute are the same curve with itself.

LOG'GATS,† *n.* The name of a play or game, the same as is now called *kittle-kins*. It was prohibited by Stat. 33 Henry VIII.

LOG'IC, *n.* [Fr. *logique*; It. *logica*; L. *id.*; from the Gr. λογικη, from λογος, reason, λεγω, to speak.] Various definitions have been given of logic, some including too little, and others too much. Logic has been called the Art of Reasoning: this definition has been properly amended by calling it the Science as well as the Art of Reasoning; meaning, by the former, the analysis of the mental process which takes place whenever we reason; and, by the latter, the rules grounded upon that analysis for conducting the process correctly. But the word Reasoning, again, is ambiguously used. In one of its acceptations it means syllogizing, or that mode of inference which may be called concluding from generals to particulars. The better definition of this term, however, and that which accords more with the general usage of the English language, makes it signify the inferring of any assertion from assertions already admitted. But the province of logic is wider than reasoning even in this extensive sense, for it undoubtedly includes, for instance, precision of language and accuracy of classification; in other words, definition and division. These various operations might be brought within the compass of the science, by defining logic as the science which treats of the operations of the human understanding in the pursuit of truth. This definition, however, includes too much. Truths are known to us in two ways: some are known directly and of themselves; some through the medium of other truths. It is only with the latter that logic has to do. Logic is not the science of belief, but the science of proof. But as the far greatest portion of our knowledge, whether of general truths, or of particular facts, is avowedly matter of inference, our definition of logic is in danger of including the whole field of knowledge; unless we qualify it by some further limitation, showing where the domain of the other arts and sciences, and of common prudence, ends, and that of logic begins. The distinction is, that the science or knowledge of the particular subject matter furnishes the evidence, while logic furnishes the principles and rules of the estimation of evidence: logic points out what relations must subsist between data, and whatever can be concluded from them. "Logic, then, is the science of the operations of the understanding which are subservient to the estimation of evidence: both the process itself of proceeding from known truths to unknown, and all intellectual operations auxiliary to this." Logic was highly valued, perhaps overvalued, among the ancient philosophers. The Stoics in particular were celebrated for their application of its principles to their own favourite metaphysical discussions. From the abuse of logical knowledge arose the celebrated fallacies of the Sophists. Zeno is called the father of logic or dialectics; but it was then treated with particular reference to the art of disputation, and soon degenerated into the minister of sophistry. It is to Aristotle, however, that the science owes, not only its first exposition, but its complete development. His logical writings were called *Organon* in later ages, and for almost two thousand years after him maintained authority in the schools of the philosophers, and in the middle ages it became the foundation of the scholastic philosophy, which was little better than a revival, under another form, of the logic of the Athenian Sophists. [*See* ORGANON.]

In this country, longitudes are reckoned from the meridian of the royal observatory at Greenwich. The *difference of longitude* of two places is the arc of the equator intercepted between their meridians. It is equal to the excess of the one longitude above the other when they are of the same name, (that is, both east or both west,) and to their sum when of contrary names. [*See* LIGHT.] The primary sense is to stretch, to extend, to shoot; hence, to direct the eye. We observe its primary sense is nearly the same as that of *seek.* Hence, to *look for* is to *seek.*] 1. To direct the eye toward an object, with the intention of seeing it. When the object is within sight, *look* is usually followed by *on* or *at.* We *look on* or *at* a picture, we *look on* or *at* the moon; we cannot *look on* or *at* the unclouded sun without pain. *At*, after *look*, is not used in our version of the Scriptures. In common usage, *at* or *on* is now used indifferently in many cases, and yet in other cases, usage has established a preference. In general, *on* is used in the more solemn forms of expression. Moses was afraid to *look on* God. The Lord *look on* you and judge. In these and similar phrases, the use of *at* would be condemned, as expressing too little solemnity. In some cases *at* seems to be more properly used before very distant objects; but the cases can hardly be defined. The particular direction of the eye is expressed by various modifying words; as, to *look down*, to *look up*, to *look back*, to *look forward*, to *look from*, to *look round*, to *look out*, to *look under.* When the object is not in sight, *look* is followed by *after*, or *for.* Hence, to *look after*, or *look for*, is equivalent to *seek* or *search*, or to expect.—2. The sense is probably to be prompt, free, willing, from leaning, advancing, or drawing forward.] 1. In a *general sense*, to be pleased with; to regard with affection, on account of some

qualities which excite pleasing sensations or desire of gratification; to regard with the feelings of one sex toward the other; to desire as an object of possession or enjoyment; to delight in. We *love* a friend on account of some qualities which give us pleasure in his society. We *love* a man who has done us a favour; in which case gratitude enters into the composition of our affection. We *love* our parents and our children, on account of their connection with us, and on account of many qualities which please us. We *love* to retire to a cool shade in summer. We *love* a warm room in winter. We *love* to hear an eloquent advocate. The Christian *loves* his Bible. In short, we *love* whatever gives us pleasure and delight, whether animal or intellectual; and if our hearts are right, we *love* God above all things, as the sum of all excellence and all the attributes which can communicate happiness to intelligent beings. In other words, the Christian *loves* God with the *love* of complacency in his attributes, the *love* of benevolence toward the interests of his kingdom, and the *love* of gratitude for favours received.

2. To have benevolence or good will for; John iii.—3. As a mere instinctive passion, to lust after.

LŎVE, *n.* An affection of the mind excited by beauty and worth of any kind, or by the qualities of an object which communicate pleasure, sensual or intellectual. It is opposed to *hatred*. *Love* between the sexes, is a compound affection, consisting of esteem, benevolence, and animal desire. *Love* is excited by pleasing qualities of any kind, as by kindness, benevolence, charity, and by the qualities which render social intercourse agreeable. In the latter case, *love* is ardent friendship, or a strong attachment springing from good will and esteem, and the pleasure derived from the company, civilities, and kindnesses of others. Between certain natural relatives, *love* seems to be in some cases instinctive. Such is the *love* of a mother for her child, which manifests itself toward an infant, before any particular qualities in the child are unfolded. This affection is apparently as strong in irrational animals as in human beings. We speak of the *love* of amusement, the *love* of books, the *love* of money, and the *love* of whatever contributes to our pleasure or supposed profit. The *love* of God is the first duty of man, and this springs from just views of his attributes or excellencies of character, which afford the highest delight to the sanctified heart. Esteem and reverence constitute ingredients in this affection, and a fear of offending him is its inseparable effect.—2. Liking; union; concord.—3. MACHĪNE, *n.* [Fr from L. *machina.*] 1. Any contrivance or thing which serves to increase or regulate the effect of a given force, or to produce motion. Or, it is any object, by the intervention of which a moving power is made to act upon any body, and overcome the force by which the latter resists the effort to change its state of rest or of motion. A machine differs in no respect from a tool, an instrument, or an engine. The word *tool*, however, is generally applied to an object, which, when used, is held in the hand of the operator; the term *instrument* also has usually the same application. Machines are divided into *simple*, and *compound*, *complex*, or *complicated*. The *simple* machines are the six mechanical powers, viz., the lever, the pulley, the axis and wheel, the wedge, the screw, and the inclined plane. *Compound* machines are such as combine two or more of these powers for the production of motion or force. Compound machines are classed under

different denominations according to the forces by which they are put in motion, as *hydraulic* machines, *pneumatic* machines, &c.; or according to the purposes which they are intended to serve, as *agricultural* machines, *printing* machines, *spinning* machines, &c. The powers employed to give motion through machines, to any object, are produced by the muscular strength of men and animals; the actions of weights, springs, wind, water, steam, fired gunpowder. The initial force which puts a machine in motion is called the *first* or *prime mover*, the point at which that force is applied is called the *acting* or *impelled point*, and that in which the effect is produced is the *working point*.—*Useful effect of a machine* [See under EFFECT.]—*Maximum effect of a machine*, the greatest effect which it can produce in a given time, or it is the amount of its performance in a given time when it is working to the greatest possible advantage. In every machine, simple or complex, it is an established principle, in regard to useful effect, that the momentum of the resistance is equal to the momentum of the power or impulse. Another principle is generally laid down in regard to machines; namely, that as much is lost in time as is gained in power, but this rule requires some modification. In all cases, the working power is essentially less than the moving power; and in complex machines, it is greatly less, by reason of the great degree of friction and inertia to be overcome. Hence, to prevent loss of power, every machine should be as simple as possible in its construction, provided it can be made to answer the purpose intended The utility of machinery, in its application to manufacture, consists in the addition which it makes to human power, the abridgment of human labour, the economy of time, and the conversion of substances, apparently worthless, into valuable products. The forces derived from wind, water, and steam, are so many additions to human power, and the whole inanimate force thus obtained in Great Britain, has been calculated to be equivalent to that of 20,000,000 labourers.—2. An engine; an instrument of force.—3. Supernatural agency in a poem, or a superhuman being introduced into a poem to perform some exploit.

MACHINE, *v. t.* To print by means of a printing machine.

Machines in general. The *machinery* of a cotton-mill is often moved by a single wheel.—3 In *epic* and *dramatic poetry*, superhuman beings introduced by the poet to solve a difficulty, or perform some exploit which exceeds human power; or the word may signify the agency of such beings as supposed deities, angels, demons, and the like.

> Nec deus intersit, nisi dignus vindice nodus Incidit. *Horace.*

Lunier says, from Gr. μαγνης, the loadstone; but the reason he does not assign.] A primitive earth, having for its base a metallic substance, called magnesium, of which it is the protoxide. It is a white tasteless earthy

substance, possessing alkaline properties, and having a specific gravity of 2·3. It is absorbent, antacid, and mildly cathartic. It is almost insoluble. It is found native in the state of hydrate and carbonate, and exists as a component part of several minerals. In *com.* pure magnesia is generally distinguished by the term *calcined magnesia*, and is readily obtained by exposing its hydrated carbonate to a red heat The hydrated carbonate goes by the name of *magnesia*, or *magnesia alba*. The chief use of magnesia and its carbonate is in medicine. Sulphate of magnesia is well known by the name of Epsom salt, having been first obtained from a spring at Epsom. It is a useful purgative medicine, and is also employed in the preparation of magnesia and its carbonate. Magnesia forms a great number of double salts.

MAGNE'SIAN, *a.* Pertaining to magnesia, or partaking of its qualities.—*Magnesian limestone*, a marine deposit belonging to the new red sandstone group. It lies above the red conglomerate, and below the variegated sandstone. It is composed of carbonate of lime and carbonate of magnesia; hence the name. It forms a very durable stone for building

MAG'NESITE, *n.* Carbonated magnesia, or magnesia combined with silex. It occurs in amorphous masses, or in masses tuberous and spongiform: its colour is yellowish gray, or white with spots, and dendritic delineations of blackish brown.

MAGNE'SIUM, *n.* The metallic base of magnesia. It may be obtained by decomposing chloride of magnesium by means of potassium. It is of a white colour like silver; its lustre is metallic and brilliant; it is very malleable, and fuses at a red heat. Heated to redness in oxygen gas, it burns with brilliancy, and combining with oxygen becomes magnesia, or the protoxide of magnesium, which consists of 61.21 parts of magnesium, and 38.79 of oxygen. Magnesium combines with chlorine, bromine, fluorine, and iodine, forming chloride, bromide, fluoride, and iodide of magnesium

MAG'NET, *n.* [L. from Gr. μαγνης, from *Magnesia*, in Asia Minor.] The loadstone; an ore of iron which has the peculiar properties of attracting metallic iron, of pointing to the poles, and of dipping or inclining downward. These properties it communicates to iron by contact. A bar of iron to which these properties are imparted, is called an *artificial magnet*.—*Artificial magnets* are made of small bars of iron or steel, which, when placed at perfect liberty, turn one end towards the north, and the other, consequently, in a southerly direction. These two points are termed the *north* and *south poles* of the magnet; and a line, supposed to connect these points, is its axis. The tendency to acquire a direction nearly north and south is its polarity. Either pole of the magnet attracts iron; and two magnets repel each other when their north or south poles are brought together, and attract when their contrary poles are brought together. Slight poles, formed at irregular points of the bar, and which tend to disturb the attraction of the real ones, are termed *consecutive poles*.—*Horse-shoe magnets*, artificial magnets made in the shape of a horse-shoe; a number of these laid together, and fastened firmly, in a leathern or copper case, forms a magnetic battery.—2. Steel having magnetic properties.

MAGNET'IC, } *a.* Pertaining to
MAGNET'ICAL, } the magnet; possessing the properties of the magnet, or corresponding properties; as, a *magnetic* bar of iron, or a *magnetic* needle. -2. Attractive.

> She that had all *magnetic* force alone *Donne.*

Magnetic curves, the name given to those curves into which an infinite number of very minute needles would arrange themselves when placed round a magnet, and at liberty to move round an axis An idea of these curves is given by the appearance of iron filings, when scattered upon a sheet of paper, and agitated immediately above a magnet.—*Magnetic fluid*, a hypothetic fluid, by which the phenomena of magnetism have been accounted for.—*Magnetic meridian of any place*, a great circle, the plane of which passes through that place, through the centre of the earth, and the direction of the horizontal magnetic needle. The angle which the magnetic meridian makes with the true geographical, is different in different places and at different times, and is called the *variation of the compass*.—*Magnetic equator*, a line passing round the globe near its equator, in every part of which the dip of the needle is nothing. The general inclination of the magnetic to the terrestrial equator is about 12°. *Magnetic poles of the earth*, two opposite points on the earth's surface where the dip of the needle is 90°.—*Magnetic induction*, the power which a magnet possesses of exciting temporary or permanent magnetism in such bodies in its vicinity as are capable of receiving it.—*Magnetic intensity*, the force of attraction which magnets exert on surrounding bodies containing the magnetic fluid, or which the earth exerts on magnets at different places. The intensity of the attractive force exercised by the north pole of one magnet on the south pole of another, and its repulsive force on the north pole of the second, varies inversely as the square of the distance of those poles.

MAGNET'ICALNESS, *n.* The quality of being magnetic.

MAGNET'IC COMPEN'SATOR. A contrivance devised by Mr. Barlow, for eliminating the influence of a ship's guns and other iron, in deranging the bearings of the compass. It consists of a plate or combination of plates of iron placed near the binnacle, so as to counteract by an equal and opposite attraction that of the rest of the iron on board of the vessel. Mr. Airy has given a set of practical rules for correcting the disturbing forces by means of two powerful magnets placed at right angles to each other below the compass, and a box of small iron, which is used instead of Barlow's correcting plate.

MAGNETIC IRON ORE, or **MAGNETIC PYRITES.** A black ore possessing a slight metallic lustre. It is magnetic, sometimes sufficiently so to take up a needle. It occurs in beds in primary and transition rocks, and is very common in Sweden.

That peculiar property, occasionally possessed by certain bodies (more especially by iron and some of its compounds), whereby, under certain circumstances, they naturally attract or repel one another according to determinate laws.—*Animal magnetism*, a sympathy supposed to exist between the magnet and the human body, by means of which the magnet is said to be able to cure diseases. The same name was given by Mesmer in the latter part of the eighteenth century to certain phenomena produced by the action of one person upon another, from a fancied analogy between the action of the mineral magnet, and that of the animal energy, or *vis vitæ*, to which these effects were attributed. [*See* MESMERISM.] The footing which this pretended science has gained, and the effects which it has produced, exemplify strikingly the power of imagination.—*Terrestrial magnetism*, the name given to the magnetic fluid, or power supposed to reside in the earth, which gives the needle its directive power, and causes it to dip, and which also communicates magnetism to iron or steel placed in certain situations. It is found that all metals are more or less susceptible of magnetism.

The amount of any one of these taken in reference to some standard of the same kind of quantity as that spoken of, was called its magnitude. The term was gradually enlarged in its signification, so as to apply to every kind of quantity that admits of exhibition or mensuration, or of which greater or less can be predicated.—2. This angle may be considered to be inversely as the distance of the object. This term is chiefly used when speaking of the heavenly bodies, but is also used in many branches of optical science.

Intent is the material ingredient in offences of this nature, but as the law presumes malice in the very commission of the act, it lies on the party indicted to rebut the presumption of malice, or sufficiently explain the act.—In *Scots law*, malicious mischief is an indictable offence, whether it has proceeded from malice or gross misapprehension of right. The punishment is arbitrary.

MALT, *n.* [Sax. *mealt;* G. *malz;* Sw. and Dan. *malt.* Qu. W. *mall,* soft.] Grain, usually barley, which has become sweet, and more soluble in water by the conversion of its starch into sugar, by artificial germination to a certain extent, called *malting,* after which this process is stopped. The grain is first steeped in cold water for a period not less than forty hours, when it swells, and becomes somewhat tender. The water being then drained away, the grain is spread about two feet thick upon a floor, where it heats spontaneously, and begins to grow by first shooting out the radicles. In this state the germination is stopped by spreading it thinner, and turning it over for two days; after which it is made into a heap and suffered to become sensibly hot. Lastly, it is conveyed to the kiln, where, by a gradual and low heat, it is rendered dry and crisp. This is malt. After having been crushed in a kind of mill contrived for the purpose, its saccharine and mucilaginous portions are extracted by boiling water. The liquor thus produced is termed *wort,* which having been fermented and flavoured with hops, &c., constitutes ale or beer. In *Scotland* and *Ireland,* whisky is distilled from the unfermented wort.

their emollient properties. In France, the marsh-mallow is much used. Those of Europe are mostly annuals, of which three are found in Britain. The *M. sylvestris,* or common mallow, is possessed in every part of mucilaginous properties. The whole plant is used officinally in Britain, being used chiefly in fomentations, cataplasms, and emollient enemas. When fresh, the flowers are violet-coloured, but on drying become blue, and yield their colouring principle both to water and alcohol. The alcoholic tincture furnishes one of the most delicate of reagents for testing the presence of alkalies or acids. *M. tricuspidata* is employed in the West Indies as a substitute for soap.

MALVA'CEÆ, *n.* A large natural order of exogenous plants, the distinguishing marks of which are polypetalous flowers, monadelphous stamens, unilocular anthers, and a valvate calyx. A large proportion of the order consists of herbaceous, or annual plants, inhabiting all the milder parts of the world, but found most plentifully in hot countries. Several species are of essential service to man. As emollients they are well known in medical practice. The hairy covering of the seeds of the various species of gossypium, forms the raw cotton, so important to our manufacturers. The altheas, sidas, and hibiscuses, are splendid flowering plants.

Mammalia.* [L. *mamma,* the breast.] In *zool.,* an animal that suckles its young. *Mammals,* or *mammalia,* is the name given to that class of animals which suckle their young by teats or nipples. They are placed at the head of the animal kingdom, comprehending man, and all animals which, like man, possess a viviparous mode of generation. These animals have a heart, consisting of four cavities, a double system of circulation, red and warm blood; the fetus is nourished in the matrix by means of one or more placentæ, and the young by milk secreted by the breasts. Linnæus divides the class Mammalia into seven orders; viz., primates, bruta, feræ glires, pecora, belluæ, and cete. Cuvier divides his class, Mammalia, into eight orders; viz., bimana, quadrumana, carnassiers, rodentia, edentata, pachydermata, ruminantia, and cetacea. This animal appears to have had the feet, tusks, trunk, and many other particulars of conformation in common with the elephant, but it differed from the elephant in its grinders. Two species have been distinguished. The bones of the mammoth have been found in great abundance in Siberia; they have also been found in Yorkshire. An entire carcass was discovered towards the close of last century on the banks of the river Lena. Men.* [Sax. *man*, *mann* and *mon*, mankind, man, a woman, a vassal, also one, any one, like the Fr. *on*; Goth. *manna*; Sans. *man*; D. *man*, a man, a husband; *mensch*, a human being, man, woman, person; G. *id.*; Dan. *man*, *menneske*; Sw. *man*, *meniskia*; Sax. *mennesc*, human; Ice. *mann*, a man, a husband; W. *mynw*, a person, a body from *mwn*, that which rises up or stretches out. The primary sense is form, image, whence species, coinciding probably with the Fr. *mine*, Eng. *mien*, Arm. *man* or *min*, look, aspect, countenance; Ch. and Heb. מין, *min*, species, kind; Heb. תמונה, *temunah*, image, similitude. It is remarkable that in the Icelandic, this word, a little varied, is used in Gen. i. 26, 27. "Og Gud sagde, ver vilium gera mannenn, epter *mind* og liking vorre." And God said, Let us make man after our *image* and likeness. "Og Gud skapade mannenn epter sinne *mind*, epter Guds *mind* skapade hann hann, og han skapade thau karlman og kvinnu." Literally, And God shaped man after his *image*, after God's *image* shaped he them, and he shaped them male and female; *karlman*, male, [*see* CARL and CHURL,] and *kvinnu*, female, that is, *queen*, woman. *Icelandic Bible.* *Man* in its radical sense, agrees almost precisely with *Adam*, in the Shemitic languages.] 1. Mankind; the human race; the whole species of human beings; beings distinguished from all other animals by the powers of reason and speech, as well as by their shape and dignified aspect. "Os homini sublime dedit."

> And God said, Let us make *man* in our image, after our likeness, and let *them* have dominion; Gen. i.

> *Man* that is born of woman, is of few days and full of trouble; Job xiv.

> My Spirit shall not always strive with *man*; Gen. vi.

> I will destroy *man* whom I have created; Gen. vi.

> There hath no temptation taken you, but such as is common to *man*, 1 Cor. x.

> It is written, *Man* shall not live by bread alone; Matt. iv.

> There must be somewhere such a rank as *man*. *Pope.*

> Respecting *man*, whatever wrong we call, *Pope.*

> But vindicate the ways of God to *man*. *Pope.*

> The proper study of mankind is *man*. *Pope.*

> In the System of Nature, *man* is ranked as a distinct genus. *Encyc.*

When opposed to *woman*, *man* sometimes denotes the male sex in general.

> *Woman* has, in general, much stronger propensity than *man* to the discharge of parental duties. *Cowper.*

Blumenbach divides mankind into five varieties:—1. Caucasian variety, having the skin white. 2. The Mongolian variety, of an olive colour. 3. The Ethiopian variety, the skin and eyes black. 4. The American variety, the skin dark, and more or less of a red tint. 5. The Malay variety, the colour varying from a light tawny to a deep brown.—2. A male individual of the human race, of adult growth or years.

> The king is but a *man* as I am. *Shak.*

> And the *man* dreams but what the boy believed. *Dryden.*

3. A male of the human race; used often in compound words, or in the nature of an adjective; as, a *man*-child; *men*-cooks; *men*-servants.—4. A servant, or an attendant of the male sex.

5. A word of familiar address.

> We speak no treason, *man*. *Shak.*

6. It sometimes bears the sense of a male adult of some uncommon qualifications; particularly, the sense of strength, vigour, bravery, virile powers, or magnanimity, as distinguished from the weakness, timidity, or impotence of a boy, or from the narrow-mindedness of low-bred men.

> I dare do all that may become a *man*. *Shak.*

> Will reckons he should not have been the *man* he is, had he not broke windows. *Addison.*

7. An individual of the human species.

> In matters of equity between *man* and *man*. *Watts.*

Under this phraseology, females may be comprehended. So a law restraining *man*, or *every man* from a particular act, comprehends women and children, if of competent age to be the subjects of law.—8. *Man* is sometimes opposed to *boy* or *child*, and sometimes to *beast*. —9. One who is master of his mental powers, or who conducts himself with his usual judgment. When a person has lost his senses, or acts without his usual judgment, we say, he is not his own *man*.—10. It is sometimes used indefinitely, without reference to a particular individual; any person; one. This is as much as a *man* can desire.

> A *man*, in an instant, may discover the assertion to be impossible. *Moore.*

This word, however, is always used in the singular number, referring to an individual. In this respect it does not answer to the French *on*, nor to the use of *man* by our Saxon ancestors. In Saxon, *man ofsloh* signifies, *they slew*; *man sette up*, *they set* or *fitted out*. So in German, *man sagt* may be rendered, *one says*, *it is said*, *they say*, or *people say*. So in Danish, *man siger*, *one says*, *it is said*, *they say*.—11. In *popular usage*, a husband.

> Every wife ought to answer for her *man*. *Addison.*

A name also generally given to a black mineral, originally described by Scheele, as a peculiar earth, but which was afterwards shown by Gahn to be the oxide of a metallic substance which he called *magnesium*. This term, however, having been applied to the metallic base of magnesia, the word *manganese* was adopted to designate the metal, while the ore above alluded to was called black, or peroxide of manganese; but later chemists have proposed to give to the metal the name *manganesium* or *manganium*. The former name, however, is still used for the metal. The common ore of manganese is the black, or peroxide, a valuable substance to chemists, as that from which oxygen is most easily obtained. The oxides of manganese, and especially the binoxide, are largely employed in the preparation of chlorine, for the manufacture of bleaching-powder, or chlorate of lime. It is employed in glass-making, to correct the yellow colour which oxide of iron is apt to impart to the glass. It is also used in making the black enamel of pottery. One of the ores of manganese, *black wadd*, is remarkable for its spontaneous inflammation when mixed with oil.

It has not hitherto been obtained in a separate state, but when hydrate or carbonate of potassa or nitre is fused with peroxide of manganese, a dark coloured compound is obtained, long known under the name of *cameleon mineral*, from the property of its solution to pass rapidly through several shades of colour. This substance has since been termed manganate of potash, and has been proved to contain 1 atom of manganese, and 3 of oxygen, which has been called *manganic acid. Permanganic acid* contains 2 atoms of manganese and 7 of oxygen. Sulphate of manganese has been lately employed to give a brown colour in calico-printing. As formerly made it consisted of an oblong rectangular wooden chest, which rested upon two cylinders. The chest is loaded with stones to make it press with sufficient force upon the cylinders. By moving the loaded chest backwards and forwards, by means of a wheel and pinion, the rollers are made to pass over the linen, spread on a polished table underneath, and thus render it smooth

and level. Mangles of this construction have, however, of late been very much superseded by the patent mangle, a machine which occupies much less space, and is much more easily managed than the one above described. MAN'NA, *n.* [Heb. מן הוא, *man hu*, what is it? or, what is this?] 1. A substance miraculously furnished, as food for the Israelites in their journey through the wilderness of Arabia; Ex. xvi. Our English version of Ex. xvi. 15, as it contains a glaring contradiction, cannot be right. The Hebrew for manna is *man hu*, which some take to mean this is a gift or portion, and others, as our translators, think it a proper name; but neither of these interpretations agrees with the following words: "*for they wist not what it was.*" It is therefore best to understand *man hu* as an interrogative, and the passage will run as follows: "When the children of Israel saw it, they said one to another, What is it? for they knew not what it was." And in consequence of this question Moses, in reply, says, "This is the bread," &c. This rendering is farther confirmed by the fact stated here, and in Deut. viii. 3, 16, that the Israelites had never seen it before. From this circumstance it was called *manna*, Ex. xvi. 31. What the substance was is unknown. It was supplied miraculously, and was unlike any of those substances which now go by the name of manna.—2. In *the materia medica*, the sweet concrete juice which is produced from several species of ash, such as *Ornus europæa* and *rotundifolia*, natives of Sicily, Calabria, and other parts of the south of Europe. It is either naturally concreted, or exsiccated and purified by art. The best manna is in oblong pieces or flakes of a whitish or pale yellow colour, light, friable, and somewhat transparent. It has a slight peculiar odour, and a sweetish taste mixed with a slight degree of bitterness, and altogether leaves a disagreeable impression. It is employed as a gentle laxative for children or persons of weak habits. It is, however, generally used as an adjunct to other more active medicines. Other sweetish secretions exuded by some other plants growing in warm and dry climates, are considered to be kinds of manna.

Animal, vegetable, and mineral substances are used for this purpose. Animal substances employed as manures comprehend the putrefying carcasses of animals, ground bones, the excrements of animals, as the dung of horses, cattle, sheep, poultry, &c.; urine, guano (the decomposed excrement of aquatic birds, recently applied as a manure); the scrapings of leather, horn, and the refuse of the shambles, the hair or wool of animals. Almost every kind of vegetable substance, in one state or another, is used as manure. The principal mineral substances employed as manures are lime and other alkaline substances, chalk, sand, clay, marl, &c. Manures have been divided into stimulating and nourishing. All saline substances are ranked under the first, and all organic substances under the second. Chalk, marl, clay, and sand, do not belong to either of these divisions, but may be considered as added to the soil for the purpose of improving its mechanical texture. According to Liebig, the chief use of manures is not to supply plants with carbon, but with ammonia and inorganic matters. It is evident that different kinds of soil, as well as different kinds of crops, require different kinds of manure; and the best modes of adapting manures to various kinds of soil and crops, are laid down in agricultural chemistry. The term is limited by mineralogists and geologists to the several varieties of carbonate of lime which have more or less of a granular and crystalline texture. In *sculpture*, the term is applied to several compact or granular kinds of stone susceptible of a very fine polish. The varieties of marble are exceedingly numerous, and greatly diversified in colour. In modern times, the quarries of Carrara, in Italy, almost supply the world with white marble. The term is more especially applied to the boundaries between England and Wales, and England and Scotland. In the middle ages, the name *marchers* was given to the noblemen who lived on the marches of Wales and Scotland. The marches of the latter country were divided into two portions, the western and the middle marches, each of which had courts peculiar to itself, and a kind of president or governor, who was called warden of the marches. In *Scotland*, the term *marches* is used to signify the boundaries, or the marks which determine them, of conterminous estates or lands, whether large or small.—*Riding of the marches*, a practice retained in various boroughs of Scotland, with the view of preserving, in the memory of the inhabitants, the limits of their property. A public place in a city or town, where provisions or cattle are exposed to sale; an appointed place for selling and buying at private sale, as distinguished from an auction. Market is defined by statute to be the liberty by grant or prescription, whereby a town is enabled to set up and open shops, &c., at a certain place therein, for buying and selling, and better provision of such victuals as the subject wanteth: it is less than a fair, and is usually kept once or twice a week. The establishment of a market with the grant of the tolls thereunto belonging, is one of the king's prerogatives; and can only be effected by virtue of the king's grant, or by long and immemorial usage and prescription which presuppose such a grant. The general rule of law is, that all sales and contracts of any thing vendible in fairs or markets overt (that is, open markets), shall not only be good between the parties, but also binding on all those that have any right or property therein. The law of Scotland differs from that of England as to the legal effect of a sale in open market. The English law recognises the principle that property may, in some cases, be transferred by sale, although the seller has no right of property in the goods. In *Scotland*, no such privilege is attached to sales in open market; and the owner of goods sold by one who has stolen them, or to whom they may have been lent, may reclaim them from the purchaser.—2. A public building in which provisions are exposed to sale; a market-house.—3. Sale; the exchange of provisions or goods for money; purchase or rate of purchase and sale. Thus the property of cattle sold while grazing is transferred by their being marked for the buyer.

MAR'RIAGE, *n.* [Fr. *mariage*, from *marier*, to marry, from *mari*, a husband; L. *mas*, *maris.*] 1. The act of uniting a man and woman for life; wedlock; the state or condition of being married; the legal union of a man and woman for life. Marriage is regarded by the law as a civil contract binding the parties to certain reciprocal obligations, and the general principle of law respecting this, as well as other civil contracts, is, that it is to be held valid according to the usage of the country wherein it is made. Although among protestants marriage has ceased to be regarded as a sacrament, yet in most protestant countries the entrance into the married state has continued to be accompanied with religious observances. These are not, however, in the eye of the law, essential to the constitution of a valid marriage, any further than the sovereign power may have seen it proper to annex them to and incorporate them with the civil contract. By the law of England marriages may be solemnized—1. According to the rites of the church; or 2. According to the provisions of the acts 6 and 7 Will. IV., amended by 1 Vict. Marriages, according to the rites of the church, are celebrated or solemnized by banns; by notice in lieu of banns, which is a licence dispensing with the publication of banns; or, by licence from a bishop, which dispenses with both the preceding forms. By the act above mentioned, as amended by 1 Vict, marriages of dissenters, as of Jews, Quakers, Roman Catholics, and other sects and persuasions, may be legally and adequately solemnized in their own synagogues, tabernacles, chapels, or meeting houses, subject to a few necessary restrictions. By the law of Scotland marriages may be either regular, clandestine, or by mere consent, without the intervention of a clergyman. A regular marriage is performed by a clergyman, in presence of at least two witnesses, and is preceded by the proclamation of banns, according to the rules of the church. A clandestine marriage is also performed by a clergyman, but is not preceded by the publication of banns; but although such marriages are held valid, they expose the clergyman and the parties to certain penalties. The third kind of marriage may be contracted by any form of ceremony without the proclamation of banns, or the aid of a clergyman, provided the parties on the occasion express a solemn acceptance of each other as man and wife. It is also contracted by the writing of the parties without any ceremony, provided the writing express their acceptance of each other as man and wife. Also by a verbal acceptance of each other as man and wife in the presence of witnesses, or by a promise followed by intercourse. Also when a man and a woman live and cohabit together, and conduct themselves as man and wife in the society and neighbourhood of which they are members, till the belief and reputation that they are married become general, their marriage is presumed without any evidence of a marriage having been entered into. *Marriage* was instituted by God himself for the purpose of preventing the promiscuous intercourse of the sexes, for promoting domestic felicity, and for securing the maintenance and education of children.

The murder of an individual, or the slaughter of numbers of human beings, with circumstances of cruelty; the indiscriminate killing of human beings, without authority or necessity, and without forms civil or military It differs from *assassination*, which is a *private* killing. It differs from *carnage*, which is rather the effect of slaughter than slaughter itself, and is applied to the authorized destruction of men in battle, or other great destruction of lives by violence. *Massacre* is sometimes called *butchery*, from its resemblance to the killing of cattle. If a soldier kills a man in battle in his own defence, it is a lawful act; it is killing, and it is slaughter, but it is not a *massacre*. Whereas, if a soldier kills an enemy after he has surrendered, it is *massacre*, a killing without necessity, often without authority, contrary to the usages of nations, and of course with cruelty. The practice of killing prisoners, even when authorized by the commander, is properly *massacre*; as the authority given proceeds from cruelty. We have all heard of the *massacre* of the Protestants in France, in the reign of Charles IX.; and frequent instances of barbarous *massacre* occurred in the war between the Turks and Greeks. —2. Murder.

Lead exposed to the air while melting, is covered with a gray, dusky pellicle. This pellicle carefully taken off, is reduced by exposure to the joint action of heat and air, to a greenish gray powder, inclining to yellow. This oxide separated from the grains of lead by sifting, and exposed to a more intense heat, sufficient to make it red-hot, assumes a deep yellow colour. In this state it is called *massicot*. Massicot, slowly heated by a moderate fire, takes a beautiful red colour, becomes a salt composed of two equivalents protoxide of lead and one equivalent deutoxide, and obtains the name of minium. Massicot is sometimes used by painters, and it is used as a drier in the composition of ointments and plasters.

This branch comprehends mechanics, astronomy, optics, &c. These are sometimes called the *Physico-mathematical sciences*. The science of mathematics is also distinguished into *speculative* and *practical:* in the former, the properties and relations of numbers and magnitudes are contemplated; in the latter, the knowledge of those properties and relations is applied to the solution of problems, and to a variety of practical purposes in the ordinary concerns of life. Owen deduces *matter* from *mâd*, what proceeds or advances, a good; *madu*, to cause to proceed, to render productive; *mâd*, good, beneficial, that is, advancing, progressive. Here we have a clear idea of the radical sense of *good*, which is proceeding, advancing. A *good* is that which advances or promotes; and hence we see the connection between this word *mâd* and matter, pus, both both from *progressiveness.* The original verb is in the Ar. *madda*, to extend to reach or stretch, to be tall, to thrust out, to excrete, to produce pus, to yawn: derivatives, pus, sanies, *matter*. This verb in Heb. and Ch. signifies to measure, and is the same as the L. *metior*, Gr. μετρεω. In Syriac, it signifies to escape.] 1. Matter is usually divided by philosophical writers into four kinds or classes; *solid, liquid, aeriform,* and *imponderable. Solid* substances are those whose parts firmly cohere and resist impression, as wood or stone; *liquids* have free motion among their parts, and easily yield to impression, as water and wine. *Aeriform* substances are elastic fluids, called vapours and gases, as air and oxygen gas. The *imponderable* substances are destitute of weight, as light, caloric, electricity, and magnetism.—*Properties of matter.* [*See* PROPERTY.]—4. In *physical science*, in the case of a variable quantity or effect, that quantity or effect which is the greatest possible, under the circumstances in which it is placed, is termed the *maximum*. Thus in respect to the sails of a windmill, they may be placed at any angle, but there is one angular direction, on which the wind will have more power, than on any other, and this therefore is termed the *maximum*. A *mayor*, then, was originally an overseer, and among country gentlemen, a steward, a kind of domestic bailiff; rendered in the writing of the middle ages, *villicus*. *See* Spelman *ad voc.* The derivation of the word from L. *major*, is undoubtedly an error.] The chief magistrate of a city or town corporate in England and Ireland, who, in London, York, and Dublin, is called lord mayor. With these correspond the Eng. *meet*, fit, proper, and *meet*, the verb; Sax. *gemet*, meet, fit; *metan* and *gemetton*, to meet or meet with, to find, to mete or measure, and to paint. The sense is, to come to, to fall, to happen, and this sense is connected with that of stretching, extending, that is, reaching to; the latter gives the sense of *measure*. We find in Heb. מד, *mad*, measure; מדד, *madad*, to mete, to measure. This word in Ar. *madda*, signifies to stretch or extend, to draw out in length or time; as do other verbs with the same elements, under one of which we find the *meta* of the Latins. 5. Pertaining to the principles of mechanics, in philosophy; as, *mechanical* powers or forces; a *mechanical* principle.—*Mechanical affections,* such properties of matter as result from their figure, bulk, and motion.—*Mechanical causes,* such as are founded on *mechanical affections.*—*Mechanical philosophy,* also called the *corpuscular philosophy,* is that which explains the phenomena of nature, and the operations of corporeal things on the principles of mechanics; viz., the motion, gravity, figure, arrangement, disposition, greatness, or smallness of the parts which compose natural bodies. It is founded upon observation and experiment.—*Mechanical powers,* the simple instruments or elements of which every machine, however complicated, must be constructed; they are the *lever,* the *wheel and axle,* the *pulley,* the *inclined plane,* the *wedge,* and the *screw.*—*Mechanical origin,* a term used in *geol.,* to distinguish rocks of sand, pebbles, or fragments from those of *chemical origin,* or which have a regular crystalline texture.—6. Acting by physical power; as *mechanical* pressure.—7. Acting without design or intelligence.—*Mechanical curve,* a curve of such a nature that the relation between the absciss and the ordinate cannot be expressed by an algebraic equation. Such curves are now generally called *transcendental curves.* The terms *mechanical* and *chemical* are thus distinguished: those changes which bodies undergo without altering their constitution, that is, losing their identity, such as changes of place, of figure, &c., are *mechanical;* those which alter the constitution of bodies, making them different substances, as when flour, yeast, and water unite to form bread, are *chemical.* In the one case, the changes relate to *masses* of matter, as the motions of the heavenly bodies, or the action of the wind on a ship under sail; in the other case, the changes occur between the *particles* of matter, as the action of heat in melting lead, or the union of sand and lime forming mortar. Most of what are usually called the *mechanic arts,* are partly mechanical and partly chemical.

MECHAN'ICALNESS, *n.* The state of being mechanical, or governed by mechanism.

MECHANI"CIAN, *n.* One skilled in mechanics.

MECHAN'ICS, *n.* That science which treats of the doctrines of motion, or which investigates the actions of bodies on one another, either directly or by means of machinery. The term is particularly applied to the mutual actions of solid bodies: the actions of fluids on solids form, in part, the subjects of hydrostatics and hydrodynamics; but these, as well as pneumatics, are now frequently included under the general name mechanics. This science is divided into two branches, *statics* and *dynamics.* [*See* these terms.] In all the branches of general or theoretical mechanics, the investigations are founded on experiment, and are conducted by geometrical or algebraical processes; hence the science forms one of the departments of experimental philosophy, and also of mixed mathematics. This last denomination is applied to mechanics, because in the latter are involved several qualities of bodies which do not enter into the researches of pure science, such as mass or quantity of matter, inertia, hardness, elasticity, time, space, power, or force.—*Practical mechanics,* the application of the principles of mechanics to practical purposes, as the construction of machines, buildings, &c.—*Animal mechanics,* a branch of mechanics in which the principles of the science are applied to the explanation of the solid frame-work of the human body, and also of the different animal motions, the whole structure being regarded as a machine. The most important mechanical principle which comes into operation in the animal machine is that of the lever. The bones form the *arms* of the levers, the muscles, contractible at the command of the will or fancy, represent the *power,* the joints the *fulcrums,* or points of support: and the weight of the body, or of individual limbs, as it may happen, constitute the *weight* or resistance, increased, as in the case of the hands at times, by some substance carried or held by them. The arms and legs of men, and the legs of animals, are levers of the third kind, and hence they are admirably adapted for purposes of locomotion.

It is a well-known truth in *mechanics,* that the actual and theoretical powers of a machine will never coincide. *J. Appleton.*

MECHANICS' INSTITUTE, *n.* An institution, of modern origin, for the instruction and recreation of persons of the lower and middle ranks, by means of lectures, a library, museum, courses of lessons, &c. Sw. *meddela*, Dan. *meddeler*, to communicate or participate; *med*, with, and *dela*, *deeler*, to deal. *Meddle* seems to be connected with *medley*, a mixture. A memoir is often purely biographical and not historical at all, and sometimes it contains materials for biography only, and is not a biographical work in the proper sense of the term. Sometimes it is neither historical nor biographical, but merely a discourse on some point of science or literature; of this kind are the published memoirs of many academies and other literary or scientific societies. A short essay on a particular subject (especially to accompany or explain a map, view, facsimile, or other representation of a curious object in art, &c.) is also termed a memoir. The faculty of the mind by which it retains the knowledge of past events, or ideas which are past. The word *memory* is not employed uniformly in the same precise sense, but it always expresses some modification of that faculty which enables us to treasure up, and preserve for future use the knowledge which we acquire; a faculty which is obviously the great foundation of all intellectual improvement. The word *memory* is sometimes used to express a capacity of retaining knowledge, and sometimes a power of recalling it to our thoughts when we have occasion to apply it to use. The latter operation of the mind, however, is more properly called *recollection.* Hence a distinction is made between *memory* and *recollection. Memory* retains past ideas without any, or with little effort; *recollection* implies an effort to recall ideas that are past. Memory depends upon attention, without which even the objects of our perceptions make no impression on the memory, and the permanence of the impression which any thing leaves in the memory is proportioned to the degree of attention which was originally given to it. There is also a strong connection between memory and the association of ideas.

Memory is the purveyor of reason. *Rambler.*

Quicksilver, a metal whose specific gravity is greater than that of any other metal, except platinum, gold, and tungsten, being 13.56, or thirteen times and a half heavier than water. It is the only metal which is liquid at common temperatures. It freezes at a temperature of 39° or 40° below the zero of Fahrenheit; that is, at a temperature of 71° or 72° below the freezing point of water. Under a heat of 660°, it rises in fumes and is gradually converted into a red oxide. Mercury is used in barometers to ascertain the weight of the atmosphere, and in thermometers to determine the temperature of the air, for which purposes it is well adapted by its expansibility, and the extensive range between its freezing and boiling points. Preparations of this metal are among the most powerful poisons, and are extensively used as medicines. The preparation called calomel, is a most efficacious deobstruent. Another valuable preparation is corrosive sublimate. From the fluid state in which mercury exists it readily combines with most of the metals, to which, if in sufficient quantity, it imparts a degree of fusibility or softness: these compounds are termed *amalgams.* [*See* AMALGAM.] Mercury is chiefly found in the state of sulphuret, but it is also found native. MES'MERISM, *n.* The doctrine of animal magnetism, so named from its author, Frederic Anthony Mesmer, a German physician. In 1778, Mesmer propounded a theory, according to which all the phenomena of life are referred to the motion and agency of a certain universal magnetic fluid, which admits of being influenced by external agents, and especially by magnetic instruments. Wonderful effects were said to have been produced by him and others who co-operated with him, upon animal bodies, and many cures performed by the agency of a certain magnetical apparatus. The use of magnetic instruments is now quite exploded, and the principal means used to produce the effects of mesmerism are such as touching and stroking with the hands, according to rule, breathing on a person, fixing the eye upon him, &c. The mesmerized person must always be of a weaker constitution than the mesmerizer, and, if possible, of a different sex, and must also believe devoutly in the science. The effects produced upon the person to whom mesmerism is communicated, or the *mesmeree*, as he is called, consist partly in bodily sensations, as chilliness, heaviness, flying pains, &c.; partly in a diminished activity of the external senses; partly in fainting, convulsions, sleep, with lively dreams, in which the mesmeree is transported to higher regions, observes the internal organization of his own body, prophesies, gives medical prescriptions, receives inspired views of heaven and hell, purgatory, &c.; reads sealed letters laid on his stomach, and when awakened is totally unconscious of what he has experienced. Six stages or degrees of mesmerism have been enumerated, viz.—the *walking stage*, the stage of *half-sleep*, *mesmeric sleep* or *stupor*, *somnambulism*, *self-contemplation* or *clairvoyance*, *universal illumination*, in which the patient knows what is going on in distant regions, and all that has happened or will happen to those persons with whom he is brought into mesmeric relation, and so forth. More latterly, mesmerism has been associated with phrenology, so that by touching certain organs, the patient, when mesmerized, is made to dance, sing, fight, or steal, &c. The science, as a whole, is utterly unworthy of belief; but there are some facts connected with it, such as the artificial sleep and somnambulism, which are worthy of attention.

MET'AL, *n.* (met'l.) [Fr. from L. *metallum*; Gr. μεταλλον: Sw. and G. *metall*; Ir. *miotal*; W. *mettel.*] 1. A simple, fixed, shining, opaque body or substance, insoluble in water, fusible by heat, a good conductor of heat and electricity, capable, when in the state of an oxide, of uniting with acids and forming with them metallic salts. Many of the metals are also malleable or extensible by the hammer, and some of them extremely ductile. Metals are mostly fossil, sometimes found native or pure, but more generally combined with other matter. Some metals are more malleable than others, and this circumstance gave rise to the distinction of metals and semi-metals; a distinction little regarded at the present day. Recent discoveries have enlarged the list of the metals; the whole number now recognized is 43. Their names are as follows:—1. platinum; 2. gold; 3. silver; 4. palladium; 5. mercury; 6. copper; 7. iron; 8. tin; 9. lead; 10. nickel; 11. cadmium; 12. zinc; 13. bismuth; 14. antimony; 15 manganese or manganesium; 16. cobalt; 17. tellurium; 18. arsenic; 19. chromium; 20. molybdenum; 21. tungsten; 22. columbium; 23. selenium, but it is doubtful whether this substance should rank as a metal; 24. osmium; 25. rhodium; 26. iridium; 27. uranium; 28. titanium; 29. cerium; 30. potassium; 31. sodium; 32. lithium; 33. calcium; 34. barium; 35. strontium; 36. magnesium; 37. yttrium; 38. glucinium; 39. aluminium; 40. zirconium; 41. lantanium; 42. thorinum or thorium; 43. vanadium. The first twelve are malleable, and so are the 30th, 31st, and 32nd, in their congealed state. The first sixteen yield oxides, which are neutral salifiable bases. The metals 17, 18, 19, 20, 21, 22, and 23 are acidifiable by combination with oxygen. Of the oxides of the rest up to the 30th little is known. The remaining metals form, with oxygen, the alkaline and earthy bases.—2. Workers in glass, pottery, &c., give the name of *metal* to the material on which they operate.—*Road metal*, stones broken small, used in forming the surface of highways on the principles of Macadam; ballasting.—3. Courage; spirit; so written by mistake for *Mettle.*

This term is, by analogy, extended to the native metals and alloys.—*Metallic oxide*, a metal combined with any proportion of oxygen, provided it do not possess the properties of an acid.—*Metallic salts*, those salts which have a metallic oxide for their base; as carbonate of lead.—*Metallic veins*, veins or fissures in rocks filled with metallic substances.

MET'APHOR, *n.* [Gr. μεταφορα, from μεταφερω, to transfer; μετα, over, and φερω, to carry.] A short similitude; a similitude reduced to a single word; or a word expressing similitude without the signs of comparison. Thus, "that man is a fox," is a metaphor; but "that man is like a fox," is a similitude or comparison. So when I say, "the soldiers were lions in combat," I use a metaphor; but when I say, "the soldiers fought like lions," I use a similitude. In *metaphor*, the similitude is contained in the name; a man is a *fox*, means, a man is as crafty as a fox. So we say, a man *bridles* his anger, that is, restrains it as a bridle restrains a horse. Beauty *awakens* love or tender passions; opposition *fires* courage.

METAPHYS'ICS, *n.* (*s* as *z.*) [Gr. μετα, after, and φυσικη, physics. It is said that this name was given to the science by Aristotle or his followers, who considered the science of natural bodies, *physics*, as the first in the order of studies, and the science of mind or intelligence to be the second.] The science of the principles and causes of all things existing; hence, the science of mind or intelligence. This science comprehends *ontology*, or the science which treats of the nature, essence, and qualities, or attributes of being; *cosmology*, the science of the world, which treats of the nature and laws of matter and of motion; *anthroposophy*, which treats of the powers of man, and the motions by which life is produced; *psychology*, which treats of the intellectual soul; *pneumatology*, or the science of spirits or angels, &c. *Metaphysical theology*, called by Leibnitz and others *theodicy*, treats of the existence of God, his essence, and attributes. These divisions of the science of metaphysics, which prevailed in the ancient schools, are now not much re-

garded. The natural division of things that exist is into body and mind, things material and immaterial. The former belong to physics, and the latter to the science of metaphysics. In modern times the word *metaphysics* has been variously applied, and seems to assume quite a distinct meaning as employed by different authors. In this country it is usually applied to denote the philosophy of mind as distinguished from that of matter. This science treats of the association of ideas, memory, and various phenomena of mind; and as it consists merely in collecting facts, and making experiments like any other experimental science, its possibility is no more questionable than that of chemistry or electricity. The philosophy of mind, as an experimental science, has been chiefly treated by modern Scotch philosophers.

MET'APLASM, *n.* [Gr. μεταπλασμος, transformation; μετα, over, and πλασσω, to form.] In *gram.*, a general term comprehending all those figures of diction which consist in alterations of the letters or syllables of a word, taking place in three ways; by augmentation, diminution, or immutation. An augmentation at the beginning is termed *prosthesis*, in the middle *epenthesis*, at the end *paragoge*, to which may be added *diæresis*. Some are produced simply by a disturbance of the equilibrium of the atmospheric fluid, and are called *aerial meteors*, as whirlwinds, tornadoes, &c. Dew, fogs, hail, rain, snow, vapours, &c., are called *aqueous meteors*. A third class of meteors are caused by the action of the aqueous particles dispersed in the atmosphere on the rays of light, such as halos, mirage, fata morgana, parhelia, rainbow. These are called *luminous meteors*. A fourth class are the *igneous meteors*, such as aerolites, aurora borealis, fire balls, lightning, shooting-stars, &c.

Under the term meteorology it is now usual to include, not merely the observation of the accidental phenomena, to which the name of meteor is applied, but every terrestrial as well as atmospherical phenomenon, whether accidental or permanent, depending on the action of heat, light, electricity, and magnetism. In this extended signification, meteorology comprehends climatology, and the greater part of physical geography; and its object is to determine the diversified and incessantly changing influences of the four great agents of nature, now named, on land, in the sea, and in the atmosphere.

The W. *mud*, a mew, is also removal, a pass or move, a change of residence, and *mute*; and the verb *mudaw* is to change, to remove, comprehending the L. *muto* and *moto*. We have then clear evidence that *mew*, a cage, *mew*, to moult, and the L. *muto*, *moto*, and *mutus*, and Eng. *mutiny*, are all from one root. Micrometers are variously constructed; but, under almost all the forms of this instrument, the principle of operation is the same, which is, that it moves a fine wire parallel to itself in the plane of the picture of an object, formed in the focus of the telescope, and with such accuracy as to measure with the greatest precision its perpendicular distance from a fixed wire in the same plane, by which means the apparent diameters of the planets and other small angles are exactly determined. The micrometer is of the utmost value to the astronomer, and in trigonometrical surveys, military and naval operations. Also, by its application to the microscope, the power of the naturalist is materially extended.

The single microscope is nothing more than a lens or sphere of any transparent substance, in the focus of which minute objects are placed. When a microscope consists of two or more lenses, or specula, one which forms an enlarged image of objects, while the rest magnify that image, it is called a *compound microscope*. The *solar microscope* consists of a common microscope connected with a reflector and a condenser, the former being employed to throw the sun's rays on the latter, by which it is condensed to illuminate the object placed in its focus. The *lucernal microscope* is the same in prin-

ciple as the solar, except that a lamp is used, instead of the sun, to illuminate the object. The ingenuity of philosophers and of artists has been nearly exhausted in devising the best forms of object-glasses, and of eye-glasses for the compound microscope. The magnifying power of a single microscope is equal to the distance at which we could examine the object most distinctly by the naked eye, divided by the focal length of the lens. Thus, if this distance be 5 inches, and the focal length of the lens 1-10th of an inch, the linear magnifying power is 50, and the superficial magnifying power 2500. By the lineal magnifying power is meant the number of times an object is magnified in length; and by the superficial magnifying power, the number of times that it is magnified in surface. In a compound microscope the magnifying power of the object-glass is ascertained by dividing the distance of the image from the lens by the distance of the object from the same lens; and the magnifying power of the eye-glass is found by the rule for single microscopes; and those two results multiplied together will give the magnifying power of the compound microscope.

The English statute mile contains 8 furlongs, each 40 poles or perches, of 5½ yards. The statute mile is therefore 1760 yards or 5280 feet. It is also 80 surveying chains of 22 yards each. The square mile is 6400 square chains, or 640 acres. The Roman mile was 1000 paces, each 5 feet, and a Roman foot being equal to 11.62 modern English inches, it follows that the ancient Roman mile was equal to 1614 English yards, or very nearly 11/12ths of an English statute mile. MILK, *n.* [Sax. *melce*; G. *milch*, Ir. *meilg*. *See* the verb.] 1. A white fluid or liquor, secreted by certain glands in females of the class Mammalia, including the human species, and drawn from the breasts for the nourishment of their young. The milk of every animal has certain peculiarities which distinguish it from all other milk, but the general properties are the same in all. It consists chiefly of oleaginous and albuminous materials, with different salts. When milk is allowed to remain at rest it separates into two parts; a thick whitish fluid called *cream*, which collects in a thin stratum over its surface, and a more dense watery body remaining below. Butter is solidified cream, and is obtained artificially by churning. Milk which has stood for some time after the separation of the cream becomes acescent, and then coagulates. When the coagulum is pressed a serous fluid called whey is forced out, and there remains the caseous part of the milk, termed curd. Milk, however, is usually coagulated by the addition of rennet or the decoction of the stomach of a calf. The composition of milk is such that it is capable of supporting animal life without any other food. Its caseine and albumen serve for the formation of blood and for the nutrition of the animal tissues, while its sugar and fat support respiration; and it furnishes, besides, all the salts which the body requires. Milk may be brought to a dry state and powdered, in which state it will keep for a length of time; and, by dissolving it in tepid water, an artificial milk may be formed.—2. The white juice of certain plants.—3. Emulsion made by bruising seeds.

The L. *meus*, and Russ. *moi*, are also contracted.] My; belonging to me. It was formerly used before nouns beginning with vowels. "I kept myself from *mine* iniquity;" Ps. xviii. But this use is no longer retained. We now use *my* before a vowel as well as before an articulation; as, *my* iniquity. In present usage, *my* always precedes the noun, and *mine* follows the noun, and usually the verb; as, this is *my* book; this book is *mine*; it is called *my* book; the book is called *mine*: it is acknowledged to be *mine*. —*Mine* sometimes supplies the place of a noun. Your sword and *mine* are different in construction.

MINE, *n.* [Fr. *mine*, a mine or ore, whence *mineral*; It. *mina*, *miniera*; Sp. *mina*, a mine, a conduit, a subterraneous canal, a spring or source of

MIN'ERAL, *n.* [Fr. and Sp. *mineral:* Low L. *minera,* a matrix or vein of metals, whence *mineralia;* all from *mine.*] A body destitute of organization, and which naturally exists within the earth or at its surface. "Minerals were formerly divided into *salts, earths, inflammables* and *ores;* a division which serves for a general distribution: but a more scientific arrangement into *classes, orders, genera, species, subspecies,* and *varieties,* has been adopted to meet the more precise views of modern mineralogists. The description of minerals and their arrangement in systematic order must result from an investigation of their properties. These properties consist in certain relations which minerals bear to our senses or to other objects. Some of them are discoverable by mere inspection, or at most require some simple experiment to be made upon the mineral to ascertain its hardness, structure, colour, gravity, &c., while others cannot be observed without a decomposition of the mineral. All these properties are usually called characters. We hence have a twofold division of the properties or characters of minerals, into chemical and physical. Some minerals are simple or homogeneous, and others compound or heterogeneous.

The ingredients contained in the principal mineral springs of this country are, gases, carbonates, sulphates, muriates, oxide of iron, and silica. Mineral waters may in most cases be prepared artificially.—*Mineral yellow,* or patent yellow, a compound of oxide and chloride of lead, obtained by digesting powdered litharge in a solution of common salt, washing, drying, and fusing the product. MINERAL'OGY, *n.* [*mineral,* and Gr. λογος, discourse.] The science which treats of the properties of mineral substances, and teaches us to characterize, distinguish, and class them according to their properties. It comprehends the study or science of all inorganic substances in the earth or on its surface. It is divided, according to Jamieson, into two grand branches, viz., mineralogy, properly so called, and geology. *Mineralogy* treats of the properties and relations of *simple* minerals; while geology considers the successive changes that have taken place in the organic and inorganic kingdoms of nature, by examining the mineral masses of which the earth is principally composed, and the various phenomena relating to them. The history of the materials of the crust of the globe, their properties as objects of philosophical inquiry, and their application to the useful arts and the embellishments of life, with the characters by which they can be certainly distinguished one from another, form the object of mineralogy taken in its most extended sense.

If so, the word originally signified a performer on a musical instrument, who accompanied his performances with gestures, like the *histrio* and *joculator*.] A singer and musical performer on instruments. Minstrels, according to Percy, were an order of men in the middle ages who subsisted by the arts of poetry and music, and sang to the harp verses composed by themselves or others. They also appear to have accompanied their songs with mimicry and action, and to have practised such various means of diverting as were much admired in those rude times, and supplied the want of more refined entertainment. These arts rendered them extremely popular and acceptable in England and the neighbouring countries. The person of the minstrel was sacred; his profession was a passport; he was "high placed in hall, a welcome guest;" no high scene of festivity was considered complete, that was not set off with the exercise of the minstrel's talents. So long as the spirit of chivalry existed, the minstrels were protected and caressed, because their songs tended to do honour to the ruling passion of the times, and to encourage a martial spirit.

In *Great Britain*, formerly, there was a *mint* in almost every county; but the privilege of coining is now considered as a royal prerogative in this country, and as the prerogative of the sovereign power in other countries. They have an agreeable odour, and partake in the highest degree of the tonic and stimulating properties which are found in all labiate plants.—*Spearmint*, (*M. viridis*,) is that which is so generally used in this country, mixed with vinegar and sugar, as a sauce.—*Peppermint*, (*M. piperita*,) yields the well-known stimulating oil of the same name.—*Pennyroyal-mint*, (*M. pulegium*,) is used for the same purposes as peppermint.

MI'OCENE, *a.* [Gr. μειων, less, and καινος, recent.] The name given by Mr. Lyell to a subdivision of the tertiary strata. According to him the European tertiary strata may be referred to four successive epochs, each characterized by containing a very different proportion of fossil shells. The first or oldest, he terms *eocene*, the second *miocene*, the third *older pliocene*, and the last or fourth *newer pliocene*. The terms *miocene* and *pliocene* are comparative; the first meaning less recent, and the other more recent; they express the more or less near approach which the deposits of these eras, when contrasted with each other, make to the existing creation, at least so far as the mollusca are concerned. The miocene period has been found to yield 18 per cent. of recent fossils; many shells belong exclusively to this period. The miocene strata contain an admixture of the extinct genera of lacustrine mammalia of the eocene series, with the earliest forms of genera which exist at the present time.

It is an optical illusion, occasioned by the refraction of light through contiguous masses of air of different density; such refraction not unfrequently producing the same sensible effect as direct reflection. It consists of an unusual elevation or apparent approximation of coasts, mountains, ships, and other objects, accompanied by inverted images. In deserts where the surface is perfectly level, a plain thus assumes the appearance of a lake, reflecting the shadows of objects within and around it. The mirage is commonly vertical, that is, presenting an appearance of one object over another, like a ship above its shadow in the water. Sometimes, however, the images are horizontal. [*See* LOOM.]

Mirrors are either plane, convex, or concave. Plane mirrors, or those having a plane surface, represent bodies of their natural magnitude. Convex mirrors disperse the rays, and in consequence diminish the images of objects. Concave mirrors, or those having a hollow surface, collect the rays, and reflect them to a focus in front of the mirror, thereby enlarging the image of the object. Mirrors are made of glass, silvered on the back, or of polished metal, which last are sometimes called *speculá*.—2. MOMENT'UM, *n.* [L.] In *mech.*, impetus: the quantity of motion in a moving body. This is always equal to the quantity of matter multiplied into the velocity. The comparative *momenta* of moving bodies are in a compound ratio of their quantity of matter and their velocity; that is, they are in proportion to the products of the matter and velocity when expressed in numbers. Thus a ball of 4 pounds weight, moving at the rate of 18 feet in a second, would have double the momentum; that is, it would strike against an object with twice the force that a ball of 3 pounds weight, moving at the rate of 12 feet per second, would do; because the first product (4 × 18) is double that of 3 × 12. Momentum is the force of percussion. When the velocities of two moving bodies are inversely as their quantities of matter their *momenta* are equal

But the same name is sometimes given to a kingdom or state in which the power of the king or supreme magistrate is limited by a constitution, or by fundamental laws. Such is the British *monarchy*. Hence we speak of absolute or despotic *monarchies*, of limited *monarchies*, of hereditary and elective *monarchies*. All absolute and limited monarchies have adopted the hereditary principle.

> A free government has a great advantage over a simple *monarchy*. *J. Adams.*

2. A kingdom; an empire.

MON'ASTERY, *n.* [Fr. *monastère*; Sp. *monasterio*; Low L. *monasterium*; Gr. μοναστηριον, from μονος, sole, separate; W. *mân.*] A house of religious retirement, or of seclusion from ordinary temporal concerns, whether an abbey, a priory, a nunnery, or convent. The word is usually applied to the houses of monks. Monasteries were first founded in the deserts of Upper Egypt, where Antony, commonly called the *great*, collected a number of hermits about the year 305. About the middle of the fourth century female monasteries or convents of nuns were instituted. Monastic vows were not, however, introduced till the sixth century, by St. Benedict. Useful during the ages of barbarism, when they were the abodes of temperance and piety, monasteries changed their character as they increased in wealth, and became the haunt of all kinds of vices. Their number has been much reduced in modern times.

MŎNETARY, *a.* (mun'etarey.) Pertaining to money or consisting in money.

MŎNEY, *n.* (mun'ey.) *plur. Moneys* or *Monies.* [Sax. *mynet*; D. *munt*, mint; G. *münze*; Dan. *myndt*, money or mint; Fr. *monnaie*; Ir. *monadh*; W. *mwnai*; L. and It. *moneta*. *Money* and *mint* are the same word varied.] 1. Coin; stamped metal; any piece of metal, usually gold, silver, or copper, stamped by public authority, usually with the name and arms of the prince or state that directs it to pass current, and used as the medium of commerce. We sometimes give the name of money to other coined metals, and to any other material which rude nations use as a medium of trade. But among modern commercial nations, gold, silver, and copper are the only metals used for this purpose. Gold and silver containing great value in a small compass, and being therefore of easy conveyance, and being also durable and little liable to diminution by use, are the most convenient metals for coin or money, which is the representative of commodities of all kinds, of lands, and of every thing that is capable of being transferred in commerce.—2. In a more enlarged sense, any representation of property; any thing adapted to serve as a universal equivalent for all commodities, and for which individuals readily exchange their surplus products or services—the circulating medium. Bank notes, notes of hand, letters of credit, accepted bills on mercantile firms, &c. are called *money*, as they represent coin, are used as a substitute for it, and are exchangeable for it or redeemable. If a man pays in hand for goods in bank notes or paper currency, he is said to pay in ready *money*. The use of a paper currency as a substitute for a metallic currency is accompanied with several advantages. It enables mercantile men and others to effect payments, at all distances, with great facility, safety, and despatch, and with little expense, whereas the employment of gold and silver coin for the same purpose would be attended with great inconvenience, expense, risk, and delay, besides the expense of the wear and tear of the coin. Still, the use of a paper currency has its disadvantages. Paper notes payable on demand are most commonly issued as a substitute for or repre-

sentative of coin, the issuer being bound to pay their value or the sums they profess to represent, in coin of the standard weight and purity, and so long as this regulation is really and *bonâ fide* complied with no inconvenience can result from their employment, but it must be observed that such notes are liable to a discount, and to the bankruptcy or fraudulency of the issuers; and likewise when they are issued in excess or on unsound principles, the greatest injury results, not only to individuals, but to the community at large. Money is not often used in the plural, unless in the sense of payments or receipts of money, and in speaking of the coins of different countries; as foreign *moneys*. A single coin is not called a *money*, but a piece of *money*.—3. Wealth; affluence.

Some are called *monks of the choir*, others *professed monks*, and others *lay monks*, the last being destined for the service of the convent, and having neither clericate nor literature. *Cloistered monks* are those who actually reside in the house, in opposition to *extra-monks*, who possess benefices depending on the monastery.

a person who engrosses a commodity by purchasing the whole of that article in market for the purpose of selling at an advanced price; or one who has a license or privilege granted by authority, for the sole buying or selling of any commodity. The man who retains in his hands his own produce or manufacture, is not a monopolist within the meaning of the laws for preventing monopolies.

MONOP'OLIZE, *v. t.* [Gr. μονος, sole, and πωλεω, to sell; Fr. *monopoler*.] 1. To purchase or obtain possession of the whole of any commodity or goods in market with the view of selling them at advanced prices, and of having the power of commanding the prices, as, to *monopolize* sugar or tea.—2. Such exclusive rights were very common in Great Britain previous to the accession of the House of Stuart, but they were abolished by an Act of 1624, the 21 James I. c. 3. This act excepts patents for fourteen years, for the sole working or making of any new manufactures, to the true and first inventors of such manufactures. It also excepts grants by act of parliament to any corporation, company, or society for the enlargement of trade, and letters patent for the making of gunpowder, &c. There is one species of monopoly sanctioned by the laws of all countries that have made any advances in the arts, namely, the exclusive right of an invention or improvement for a limited number of years. The exclusive right of an author to the publication of his own works, is not, properly speaking, a monopoly, but rather a right of property. *Monopolies* by individuals obtained by engrossing, are an offence prohibited by law. But a man has by natural right the exclusive power of vending his own produce or manufactures, and to retain that exclusive right is not a *monopoly* within the meaning of law.

MONTH, *n.* [Sax. *monath*, from *mona*, the moon; G. *monath*; L. *mensis*; Gr. μην, a month, from μηνη, the moon.] A space or period of time constituting a division of the year. *Month* originally signified the time of one revolution of the moon, or the period from one change or conjunction of the moon with the sun to another, a period whose average length is 29 days, 12 hours, 44 minutes, 2.9 seconds. This is the *periodic month*, or *lunation*, or as it is commonly called, the *lunar month*. But the moon's period may be determined in relation to several celestial objects, as the sun, the equinoctial points, a fixed star, the perigee, or the nodes of her orbit, and accordingly astronomers reckon as many different lunar months as there are assumed points of comparison, on the supposition that these points have different motions in the heavens. 1. The proper *lunar month*, or *lunation*, which is the time that elapses between two consecutive full moons, or in which the moon returns to the same position relatively to the earth and sun; its average length is given above.—2. The *tropical month*, or time of the moon's revolution with respect to the movable equinox. Its average length is 27 days, 7 hours, 43 minutes, 4.7 seconds.—3. The *sidereal month*, the interval between two successive conjunctions with the same fixed star. Average length 27 days, 7 hours, 43 minutes, 11.5 seconds.—4. The *anomalistic month*, or revolution from perigee to perigee. Average length 27 days, 13 hours, 18 minutes, 37.4 seconds.—5. The *nodical month*, or the time from a node to a node. Average length 27 days, 5 hours, 5 minutes, 36 seconds. These revolutions are not uniform, but are subject to periodic and secular variations. We also apply the term *month* to the space of time in which the sun passes through one sign, or a twelfth part of the zodiac. This period contains 30 days, 10 hours, 29 minutes, 5 seconds, and is called a *solar month*. In the year, there are twelve solar months, and thirteen lunar months. In *popular language*, four weeks are called a month, being nearly the length of the lunar month. A calendar month differs in some degree from a solar month; consisting of twenty-eight, twenty-nine, thirty or thirty-one days, as the months stand in calendars or almanacs. The *civil* or *common month* is either *lunar* or *calendar*. A civil lunar month consists of twenty-nine and thirty days alternately.—*Month*, in *English statutes*, is a lunar month of twenty-eight days, unless otherwise expressed. [*See* YEAR.]

MOON, *n.* [Sax. *mona;* Goth *mena;* G. *mond;* Gr. μηνη, Doric, μανα.] 1. The heavenly orb which revolves round the earth; a secondary planet or satellite of the earth, whose borrowed light is reflected to the earth, and serves to dispel the darkness of night. The moon, after the sun, is not only the most conspicuous, but, in an astronomical point of view, the most interesting of the heavenly bodies. The variety of her phases, her eclipses, and the rapidity with which she changes her place among the fixed stars, drew the attention of the earliest observers of the heavens; while in modern times the important application of the theory of her motions to navigation, and the determination of terrestrial longitudes, has given the *lunar theory* the first rank among the objects of astronomical science. Among all the heavenly bodies the moon is the nearest to us. The mean distance of its centre from that of the earth is 59.96 of the earth's equatorial radii, or about 237,000 miles; its diameter is 2160 miles, and its magnitude about 1-49th of that of the earth; it completes its revolution round the earth, or makes the tour of the heavens in a mean or average period of 27 days, 7 hours, 43 minutes, 11.5 seconds, which constitutes the *sidereal month.* [*See* MONTH.] The motion of the moon round the earth is subject to great inequalities, arising from the sun's attraction, combined with the different positions of the moon in regard to the earth and sun; it revolves on its own axis in the same time that it takes to revolve round the earth, as appears from its always presenting the same side to the earth. The face of the moon appears to the naked eye to be diversified by dark and bright patches, which on being examined with a good telescope, are discovered to be mountains and valleys, the mountains appearing to be of a volcanic character. The moon has no clouds nor any other indication of an atmosphere.—*Harvest moon*, a phenomenon observed in our latitudes at the time of the full moon nearest to the autumnal equinox, when it happens that the moon, instead of rising 52 minutes later every day, rises for several days at the same time.—2. MOR'AL, *a.* [Fr. and Sp. *moral;* L. *moralis;* from *mos, moris*, manner. The word mostly coincides in its elements with Ar. *marra*, to pass, to walk. If the original sense of the Lat. *mos, moris* was, settled custom, the word may be from the root of *moror*, to stop, delay; Eng. *demur.*] 1. Relating to the practice, manners, or conduct of men as social beings in relation to each other, and with reference to right and wrong. The word *moral* is applicable to actions that are good or evil, virtuous or vicious, and has reference to the law of God as the standard by which their character is to be determined. The word, however, may be applied to actions which affect only, or primarily and principally, a person's own happiness.

Keep at the least within the compass of *moral* actions, which have in them vice or virtue. *Hooker.*

Mankind is broken loose from *moral* bands. *Dryden.*

2. Subject to the moral law and capable of moral actions; bound to perform social duties; as, a *moral* agent or being.—3. Supported by the evidence of reason or probability; founded on experience of the ordinary course of things; as, *moral* certainty, distinguished from *physical* or *mathematical* certainty or demonstration.

Physical and mathematical certainty may be styled infallible, and *moral* certainty may be properly styled indubitable. *Wilkins.*

Things of a *moral* nature may be proved by *moral* arguments. *Tillotson.*

4. Conformed to rules of right, or to the divine law respecting social duties; virtuous; just; as when we say, a particular action is not *moral*.—5. Conformed to law and right in exterior deportment; as, he leads a good *moral* life.—6. Reasoning or instructing with regard to vice and virtue.

Whilst thou, a *moral* fool, sitt'st still and cri'st. *Shak.*

7. In general, *moral* denotes something which respects the conduct of men and their relations as social beings whose actions have a bearing on each other's rights and happiness, and are therefore right or wrong, virtuous or vicious; as, *moral* character; *moral* views; *moral* knowledge; *moral* sentiments; *moral* maxims; *moral* approbation; *moral* doubts; *moral* justice; *moral* virtues; *moral* obligations, &c. Or *moral* denotes something which respects the intellectual powers of man, as distinct from his physical powers. Thus we speak of *moral* evidence, *moral* arguments, *moral* persuasion, *moral* certainty, *moral* force; which operate on the mind.—*Moral law*, the law of God which prescribes the moral or social duties, and prohibits the transgression of them.—*Moral sense*, an innate or natural sense of right and wrong; an instinctive perception of what is right or wrong in moral conduct, which approves some actions and disapproves others, independent of education or the knowledge of any positive rule or law. But the existence of any such moral sense is very much doubted.—*Moral philosophy*, the science of manners and duty; the science which treats of the nature and condition of man as a social being, of the duties which result from his social relations, and the reasons on which they are founded. It is denominated a science, as it deduces the rules of conduct and duty from the principles and connections of our nature, and proves that the observance of them is productive of our happiness. It is likewise called an art as it contains a system of rules for becoming virtuous and happy; and whoever practises these rules attains an habitual power or facility of becoming virtuous and happy. It is an art and a science of the highest dignity, importance, and use. Its object is man's duty, or his conduct in the several moral capacities and connections which he sustains. Its office is to direct our conduct, to show whence our obligations arise, and where they terminate. Its use or end is the attainment of happiness, and the means it employs are rules for the right conduct of our moral powers. Like natural philosophy, it appeals to nature or fact; it depends on observation, and it builds its reasonings on plain incontrovertible experiments, or upon the fullest induction of particulars which the subject will admit. The terms, *moral philosophy*, *moral science*, and *morals*, are synonymous, though some writers have employed them improperly to denote the whole field of knowledge, relating primarily to the mind of man, thus giving them a signification co-extensive with the word *metaphysics*. [*See* ETHICS.]

2. The practice of the moral duties; virtue. We often admire the politeness of men whose *morality* we question.—3. The quality of an action which renders it good; the conformity of an act to the divine law, or to the principles of rectitude. But we often apply the word to actions which accord with justice and human laws, without reference to the motives from which they proceed.—4. The leaf is taken as the representation of the type of a plant, because all the other parts are found to have a tendency to assume the organization of a leaf, when any disturbing cause interferes with their development. According to morphological writers, the scale of a leaf bud is a rudimentary leaf; the petal is a leaf reduced in size, and thinned or coloured, or both; the stamen is a leaf, whose petiole is represented by the filament, while the two lobes of the anther are the two sides of its lamina, and the pollen is the disintegrated mesophyll, and so on. Hence all the parts of a flower are merely modified leaves. It is also established by morphologists that every flower, with its peduncle and bracteolæ, is a metamorphosed branch.

Bills of mortality, abstracts from parish registers, showing the numbers that have died in any parish or place, during certain periods of time, as in each week, month, or year; and are accordingly denominated weekly, monthly, or yearly bills. They also include the numbers of the baptisms during the same periods, and generally those of the marriages. They are of great use, not only in the doctrine of life annuities, but in showing the degrees of healthiness, and prolificness, with the progress of population in the places where they are kept.—*The law of mortality*, is that which determines the proportion of the number of persons who die in any assigned period of life or interval of age, out of a given number who enter upon the same interval, and consequently the proportion of those who survive. MOR'TAR, *n.* [L. *mortarium;* Fr. *mortier;* Dan. *morter;* G. *mörser;* Ir. *moirteal;* allied perhaps to Fr. *marteau;* a hammer, and named from beating.] 1. A vessel, usually in form of an inverted bell, in which substances are either reduced to fragments, pulverized, or dissolved, by beating or trituration with a pestle. Mortars are made of different materials, such as iron, wood, stoneware, glass, &c., and of various sizes and forms, according to the use to which they are to be applied. They are much used by apothecaries and chemists.—2. A short piece of ordnance, thick and wide, used for throwing bombs, carcasses, shells, &c.; so named from its resemblance in

shape to the utensil above described. Mortars are either of iron or brass. The calibres of mortars in the British service are 4⅖, 5½, 8, 10, and 13 inches.

MOR'TAR, *n.* [D. *mortel;* Fr. *mortier;* G. *mörtel.* In other languages, as in English, the orthography of this word and of the last is the same, and perhaps this name is taken from beating and mixing.] A mixture of lime and sand with water, used as a cement for uniting stones and bricks in walls. The proportions vary from 1½ part of sand to 1 part of lime, to 4 and 5 parts of sand to 1 of lime. When limestones contain considerable portions of silica and alumina, they form what is termed *hydraulic lime*, and the mortars made with them are called *hydraulic mortars*, which are used for building piers or walls under water, or exposed to it, because they soon harden in such situations, and resist the action of the water.

Mort d'ancestor. [Fr. death of the ancestor.] In *law*, a writ of assize, by which a demandant recovers possession of an estate from which he has been ousted, on the death of his ancestor.

MOR'TER,† *n.* [Fr. *mortier.*] A lamp or light.

MORTGAGE, *n.* (mor'gage.) [Fr. *mort*, dead, and *gage*, pledge.] 1. Literally, a dead pledge; the grant of an estate in fee as security for the payment of money, and on the condition that if the money shall be paid according to the contract, the grant shall be void, and the mortgagee shall reconvey the estate to the mortgager. Formerly the condition was, that if the mortgager should repay the money at the day specified, he might then re-enter on the estate granted in pledge; but the modern practice is for the mortgagee, on receiving payment, to reconvey the land to the mortgager. Before the time specified for payment, that is, between the time of contract and the time limited for payment, the estate is conditional, and the mortgagee is called *tenant in mortgage;* but on failure of payment at the time limited, the estate becomes absolute in the mortgagee. But in this case, courts of equity interpose, and if the estate is of more value than the debt, they will on application grant a reasonable time for the mortgager to redeem the estate. This is called the *equity of redemption*.—2. The state of being pledged; as, lands given in *mortgage*.—3. A pledge of goods or chattels by a debtor to a creditor, as security for the debt.—4. In *Scots law*, a deed wed, or deed pledge, as a sum given upon lands in wadset, and under reversion.

MORTGAGE, *v. t.* (mor'gage.) To grant an estate in fee as security for money lent or contracted to be paid at a certain time, on condition that if the debt shall be discharged according to the contract, the grant shall be void; otherwise to remain in full force. It is customary to give a mortgage for securing the repayment of money lent, or the payment of the purchase money of an estate, or for any other debt.—2. To pledge; to make liable to the payment of any debt or expenditure.

In *med.*, and *sur.*, the death of one part of an animal body, while the rest is alive; or the loss of vitality in some part of a living animal; gangrene; sphacelus. *Mortification* is the local death of a part of a living animal body, which if not arrested soon extinguishes life in the whole body. We usually apply *mortification* to the *local* extinction of life in a part of a living body. The dissolution of the *whole* body after death is called *putrefaction*.—2. In *Scripture*, the act of subduing the passions and appetites by penance, abstinence, or painful severities inflicted on the body. The *mortification* of the body by fasting has been the practice of almost all nations, and the *mortification* of the appetites and passions by self-denial, is always a Christian duty.—3. Humiliation or slight vexation; the state of being humbled or depressed by disappointment, vexation, crosses, or any thing that wounds or abases pride.

MOR'TISE, *n.* (mor'tis.) [Fr. *mortaise;* Arm. *mortez;* Sp. *mortaja;* Ir. *mortis.* The Armoric *mortez* signifies both a *mortar* and a *mortise*, and the Spanish *mortaja* signifies a mortise and a winding sheet or shroud. In the latter sense the Portuguese use *mortalha*, from *mortal.* These alliances indicate that these words are all from the root of *mors*, death, which may be from beating or throwing down.] In *arch.*, a cavity cut in a piece of wood or other material, to receive a corresponding projecting piece called a *tenon*, formed on another piece of wood, &c., in order to fix the two together at a given angle. The sides of the mortise are four planes generally at right angles to each other, and to the surface where the cavity is made. The junction of two pieces in this manner is termed a

MOSA'IC, or MOSA'ICAL, *a.* (*s* as *z.*) [Fr. *mosaique;* It *mosaico;* L. *musivum.*] 1. Mosaic work is an assemblage of little pieces of glass, marble, precious stones, &c., of various colours, cut square, and cemented on a ground of stucco, in such a manner as to imitate the colours and gradations of painting. This kind of work was used in ancient times both for pavements and or-

Mosaic Pavement

namenting walls. In recent times, two kinds of mosaic are particularly famous—the Roman and the Florentine. In the former, the pictures are formed by joining very small pieces of stone, which facilitates the representation of large historical paintings. The Florentine style, which makes use of larger pieces of stone, is adapted only for small pictures.—2. [from *Moses.*] Pertaining to Moses, the leader of the Israelites; as, the *Mosaic* law, rites, or institutions.

MOSOSAU'RUS, } *σαυρος*, a lizard.] The name of a gigantic extinct aquatic saurian, occurring in the calcareous freestone, which forms the most recent deposit of the cretaceous formation. This reptile held an intermediate place between the monitor and iguana; it was about twenty-five feet long, and furnished with a tail of such construction as must have rendered it a powerful oar.

MOS'CHATEL, *n.* [from Gr. *μοσχος*, L. *muscus*, musk.] A British plant of the genus Adoxa, the *A. moschatellina*, belonging to the nat. order Araliaceæ. Its leaves and flowers smell like musk; and hence it is sometimes called *musk-crowfoot.*

MOS'CHIDÆ, *n.* A family of ruminant quadrupeds, familiarly known as musk-deer. It corresponds to the genus Moschus of Linnæus. The *musks* differ from the ordinary ruminants only in the absence of horns, in having a long canine tooth on each side of the upper jaw, which, in the male, issues from the mouth, and finally in having a slender fibula. These animals are remarkably light and elegant. [*See* MUSK.]

MOS'CHUS, *n.* Musk; an inspissated secretion from the preputial follicles of the Moschus moschiferus, a wild ruminating animal resembling the deer, and rather larger than the common cat. Musk is often adulterated. It is used in medicine as a stimulant and antispasmodic.

MOSQUE, or MOSK, *n.* [Fr. *mosquée;* Ar. *masjidon*, from *sajada*, to bend, bow, adore.] A Mohammedan temple or place of religious worship. Mosques are square buildings, generally constructed of stone. Before the chief gate is a square court paved with white marble, and surrounded with a low gallery, whose roof is supported by pillars of marble. In this gallery the worshippers wash themselves before they enter the mosque. The principal interior decoration of mosques consists in the lamps, which are numerous and singularly disposed; the direction of Mecca is pointed out by a niche or by a tablet, inscribed with verses of the Koran, called the Kebla. The Arabian mosques are remarkable for their vast quadrangles, surrounded with numerous columns; those of the Turks, for the elegance of their cupolas. Each mosque is provided with a minaret.

MOSQUI'TO, *n.* [Sp. *mosca*, and L. *musca*, a fly; Fr. *moustique.*] A gnat-like insect, genus Culex, of many species, common in America, famous for its stinging powers. It pierces the flesh by means of a long proboscis, which also forms a siphon, through which the blood flows. Humboldt says the mosquitoes of S. America belong to the genus Similium, and it is very probable that the name is applied to various gnat-like insects, as under this name travellers in all parts of the world have described the insect-pests which annoyed them.—*Mosquito nets* or *curtains*, of gauze, are often used to ward off attacks by *mosquitoes* upon persons reposing or asleep.

MOSS, *n.* [Sax. *meos;* G. *moos;* Sw. *mossa;* W. *mwswg*, from *mws*, that shoots up, and of a strong scent; L. *muscus;* Gr. *μοσχος.* The two latter signify *moss* and *musk*, both from shooting out; hence, It. *musco, muschio;* Fr. *mousse.* The Greek word signifies also a young animal, and a shoot or twig. From the French *mousse*, comes *mousseline*, muslin, from its softness or resemblance to moss. Lunier says it is from *Mossoul*, a city of Mesopotamia.] 1. The mosses are one of the families or classes into which all vegetables are divided by Linnæus in the Philosophia Botanica. In Ray's method, the mosses form the third class, and in Tournefort's they constitute a single genus. In the sexual system, they are the second order of the class Cryptogamia, which contains all the plants in which the parts of the flower and fruit are wanting or not conspicuous. The mosses, *musci*, form a natural order of small plants, with

leafy stems and narrow simple leaves. Their flowers are generally monœcian or diœcian, and their seeds are contained in a capsule covered with a calyptra or hood. The term moss is improperly applied to many other small plants, particularly *lichens*, species of which are called *tree moss, rock-moss, coral-moss*, &c. The *fir-moss* and *club-moss* are of the genus Lycopodium. [*See* Musci.]—2. [Sw. *mose.*] A bog; a place where peat is found.

MOST, *adv.* In the greatest or highest degree. Pursue that course of life which will *most* tend to produce private happiness and public usefulness. Contemplations on the works of God expand the mind and tend to produce *most* sublime views of his power and wisdom. As *most* is used to express the superlative degree, it is used before any adjective; as, *most* vile, *most* wicked, *most* illustrious.

MOST, *n.* [used as a substitute for a noun, when the noun is omitted or understood.] The greatest number or part.

Then he began to upbraid the cities wherein *most* of his migh y works were done; Matt. xi.

An animal of the genus Phalæna, which breeds in yarn and garments, and often does injury by eating the substance and destroying the texture; Matt. vi. The name is also applied to the whole genus. The genus Phalæna of Linnæus is the Nocturna of Cuvier, and forms the third family of Lepidopters, or scaly-winged insects. It is divided into ten sections, each consisting of numerous genera, differing in various details of form and habits, both in the larva or caterpillar state and that of the perfect insect.—2. *Figuratively*, that which gradually and silently eats, consumes, or wastes any thing. L. *mater*, mother; *matrix*, the womb; *materia*, matter, stuff, materials of which any thing is made. It. *madre*, mother, cause, origin, root, spring, a mould or form for castings; *matera* or *materia*, matter, subject, cause; *matrice*, the matrix. Sp. *madre*, mother, matrix, womb, the bed of a river, a sink or sewer; *madriz*, matrix; *materia*, matter, purulent running. Port. *madre*, a mother, the matrix, the channel of a river; *materia*, matter, pus. Pers. *madar*, a mother. Sans. *mada, madra, meddra* or *mata*, mother. Russ. *mat, mater*, mother; *matka*, a female, a matrix. Fr. *mère*, mother, contracted from the Latin. W. *madrez*, matter, purulent discharge. We observe that in some other languages, as well as in English, the same word signifies a female parent, and the thick slime formed in vinegar; and in all the languages of Europe here cited, the orthography is nearly the same as that of *mud* and *matter*. The question then occurs whether the name of a female parent originated in a word expressing *matter*, mould; either the soil of the earth, as the producer, or the like substance, when shaped and fitted as a mould for castings; or whether the name is connected with the opinion that the earth is the *mother* of all productions; whence the word *mother-earth*. We are informed by a fragment of Sanchoniathon, that the ancient Phenicians considered *mud*, μωτ, to be the substance from which all things were formed. [*See* Mud.] The word *matter* is evidently from the Ar. *madda*, to secrete, eject, or discharge a purulent substance; and I think cannot have any direct connection with *mud*. But in the Italian, Spanish, and Portuguese, the same word *madre* signifies mother, and a mould for castings; and the northern languages, particularly the German and Danish, seem to establish the fact that the proper sense of *mother* is matrix. Hence *mother* of pearl, the matrix of pearl. If this word had its origin in the name of the earth used for the form of castings, it would not be a singular fact; for our word *mould*, in this sense, I suppose to be so named from *mould*, fine earth. This question remains *sub judice*.] 1. A female parent; especially one of the human race; a woman who has borne a child; correlative to *son* or *daughter*.—2. That which has produced any thing.

Alas, poor country! it cannot
Be called our *mother*, but our grave. *Shak.*

So our native land is called *mother* country, and a plant from which a slip or scion is taken, is called the *mother* plant. In this use, *mother* may be considered as an adjective.—3. An appellation given to a woman who exercises care and tenderness toward another, or gives parental advice; as, when one says, a "woman has been a *mother* to me."—7. MOTHER OF PEARL, *n.* The hard silvery brilliant internal layer of several kinds of shells, particularly oysters, which is often variegated with changing purple and azure colours. The large oysters of the Indian seas alone secrete this coat of sufficient thickness to render their shells available for the purposes of manufactures. The genus of shell-fish called *Pectinidæ* furnishes the finest pearls as well as mother of

pearl. It is found in the greatest perfection round the coasts of Ceylon, near Ormus in the Persian gulf, and among some of the Australian seas. Mother of pearl shells are extensively used in the arts, particularly in inlaid work, and in the manufacture of handles for knives, buttons, toys, snuff-boxes, &c.

MOTIF'IC, *a.* [L. *motus* and *facio.*] Producing motion.

MOTIL'ITY, *n.* Capability of motion.

MO'TION, *n.* [L. *motio*; Fr. *motion*. *See* MOVE.] 1. The act or process of changing place; change of local position; the passing of a body from one place to another; change of distance between bodies; opposed to *rest*. Motion, however, is now generally considered as incapable of definition, being merely a simple idea or notion received by the senses.—*Animal motion* is that which is performed by animals in consequence of volition or an act of the will; but how the will operates on the body in producing motion, we cannot explain.—*Mechanical motion* is effected by the force or power of one body acting on another.—*Perpetual motion* is that which is effected or supplied by itself, without the impulse or intervention of any external cause. Hitherto it has been found impossible to invent a machine that has this principle. Motion may be considered under several different views. With regard to change of position, it is either *absolute* or *relative*. *Absolute motion* is an absolute change of place in any moving body, considered independently of any other motion.—*Relative motion* is the change of the relative place of a moving body, considered with respect to some other body also in motion. With regard to the powers or causes which produce motion, it is either *simple* or *compound*; *simple*, if it is produced by a single force, or by several forces acting in the same direction; *compound* if several motions meet, the various directions of which form angles with each other. With regard to the direction, the motion is *rectilineal*, or in a straight line; *circular*, or rotatory, as the motion of a wheel on its axis; *curvilinear*, or in a curve, as the motion of a ball discharged from a cannon; and *vibratory*, as the motion of a pendulum. With regard to the velocity, the motion is *equable* or *uniform*; *accelerated*, in which the velocity is continually increasing; and *retarded*, in which the velocity is continually diminishing: accelerated motion is again either *uniformly* or *variably* accelerated, and retarded motion either *uniformly* or *variably* retarded. The motions of the heavenly bodies are of two kinds, *diurnal* or *common*, and *secondary* or *proper*. *Diurnal* or *common motion* is that with which all the heavenly bodies appear to revolve every day about the earth from east to west; *secondary*, or *proper motion*, is that with which a star, planet, or the like, advances a space every day from the west towards the east, called also *direct motion*.—*Quantity of motion* is the same as *momentum*.—*Resultant motion*, that motion which results from the union of two or more forces acting in different directions.—*Laws of motion*, certain mechanical axioms laid down by Sir Isaac Newton; they are three in number. 1. Every body continues in its state of rest, or of uniform motion in a straight line, until a change is effected in it by the agency of some external force. It is sometimes called the *law of perseverance*. 2. All motion or change of motion must be proportional to the force impressed in quantity, and must be in the direction of that straight line in which the force is impressed. It is sometimes called the *law of independence*. 3. Action must always be equal and contrary to reaction; or the actions of two bodies upon each other must be equal, and directed towards contrary sides.—2. Animal life and action.

Moulds for other purposes consist of a cavity in some species of metal, cut or formed to the shape designed, or are otherwise formed, each for its particular use. MOULDINGS, *n.* In *arch.*, a general term applied to the varieties of contour given to the surfaces or edges of the various subordinate parts of buildings. Second, the *curved*, as the *astragal* or *bead*, the *torus*, the *cavetto*, the *quarter-round*, *ovolo*, or *echinus*. Third, the *composite*, as the *ogee*, *talon*, or *cyma reversa*, the *cyma recta* or *doucine*, and the *scotia* or *trochilos*. All of which are known by many other synonymes. In *Roman arch.*, these curved mouldings are formed of portions of circles; while, in *Grecian arch.*, they are formed of some conic section, and sometimes the ovolo, which in Roman architecture is a quarter of a circle, is in Grecian architecture so slightly curved as to be little more than a chamfer or inclined face. All these mouldings are frequently enriched by carving to increase their effect. In *the arch. of the middle ages*, there is a very great diversity in the form and arrangement of the mouldings. In *the Norman style*, the mouldings consist almost entirely of rounds and hollows, variously combined with splays and fillets, and a striking peculiarity of this style is the recurrence of mouldings broken into zigzag lines. In the succeeding style, *the early English*, the mouldings are lighter and more boldly cut. In *the decorated style*, there is a greater diversity, though rounds and hollows continue to prevail. This period is further characterized by the introduction of the *roll-moulding*, and another termed the *undy-bowtell* or *wave-moulding*. In *the last* or *perpendicular style*, large, and often shallow hollows prevail, and the mouldings are, in general, characterized by being flatter and less effective than those of an earlier period.

MUM'MY, *n*. [It. *mummia*. In Arabic, *momia* is wax, bees-wax, and a mummy; Pers. *moum*, wax.] A dead human body embalmed and dried after the Egyptian manner; a name perhaps given to it from the substance used in preserving it. There are two kinds of antique mummies. The first are bodies dried by the heat of the sun. Such are found in the sands of Libya. The other kind is taken from the catacombs in Egypt. An immense number of mummies has been found in the plain of Saccara near Memphis, consisting not only of human bodies, but of various animals, as bulls, apes, ibises, crocodiles, fish, &c. The processes of embalming bodies were very various. Those of the poorer classes were merely dried by salt or natron, and wrapped up in coarse cloths. The bodies of the rich and the great underwent the most complicated operations, and were laboriously adorned with all kinds of ornaments. The embalmers extracted the brain through the nostrils, and the entrails through an incision in the side. The body was then shaved and washed, the belly filled with perfumes, the whole body covered with natron, and steeped in the same material for seventy days. After this the body was washed, steeped in balsam, and then wrapped up in linen bandages, sometimes to the number of twenty thicknesses; various ornaments were placed above the bandages, particularly about the head. The body was then put into an ornamented case of sycamore wood. Sometimes the cases were double. The Egyptian mode of embalming was imitated occasionally by the Jews, Greeks, Romans, and other nations. The Guanches, or ancient people of the Canaries, embalmed their dead in a simple but effectual manner; and one cavern in Teneriffe, when discovered, had upwards of a thousand *mummies* in it, several of which had distinct, though contracted features.—2. In some situations, the conditions of the soil and atmosphere, by the rapidity with which they permit the drying of the animal tissues to be effected, are alone sufficient for the preservation of the body in the form of a *mummy*. This is the case in some parts of Peru, especially at Arica, where considerable numbers of bodies have been found quite dry, in pits dug in a saline dry soil. And in some parts of Poland natural mummies are occasionally found lying in caverns, supposed to be the remains of persons who, in time of war, took refuge in caves, but being discovered were suffocated by their enemies. These bodies are dried, with the flesh and skin shrunk almost close to the bones, and are of a blackish colour.—4. The *muriatic* acid is now known to be a compound of one equivalent of hydrogen, which performs the functions of a base, and one equivalent of chlorine, which performs the functions of an acidifier. The name which correctly expresses the composition of this acid is *chlorohydric acid.—Muriatic acid gas*, or *hydrochloric acid*, consists of chlorine and hydrogen combined, without condensation, in equal volumes. When pure, it is colourless. It fumes strongly in the air, emitting a corrosive vapour of a peculiar smell. They are formed entirely of cellular tissue, which in the stem is lengthened into tubes. Their reproductive organs are of two kinds, axillar, cylindrical or fusiform bodies, containing minute roundish particles, and thecæ or capsules, supported upon a stalk or *seta*, covered with a *calyptra*, closed by an *operculum* or lid, within which is a *peristome*, composed of slender processes named *teeth*, and having a central axis or *columella*, the space between which and the walls of the theca is filled with minute *sporules*. But others, as the heart, the urinary bladder, the stomach, &c. which are of a muscular texture, and susceptible of contraction and dilatation, are not subject to the will, and are therefore called *involuntary* muscles. The red colour of the muscles is owing to the blood-vessels which they contain. The ends of the muscles are fastened to the bones which they move, and when they act in opposition to each other, they are called *antagonist*. Muscles are divided into the head, belly, and tail. The head is the part fixed on the immovable joint called its origin, and is usually tendinous; the belly is the middle fleshy part, which consists of the true muscular fibres; the tail is the tendinous portion inserted into the part to be moved, called the insertion; but in the tendon, the fibres are more compact than in the belly of the muscle, and do not admit the red globules.—2. A name may be attached to an individual only, and is then *proper* or *appropriate*, as *John*, *Thomas*, *London*, *Paris*; or it may be attached to a species, genus, or class of things, as *sheep*, *goat*, *horse*, *tree*, *animal*, which are called *common names*, *specific* or *generic*, or *appellatives*. In the earlier state of society no individual had more than one name, but in a more advanced or refined period, one or more additional names were given in order to mark the different families to which individuals belonged, as well as to distinguish members of the same family from each other. To effect these objects, the ancient Romans generally used three names, the *prænomen*, answering to our Christian name, the *nomen*, which distinguished the *gens* or clan, and the *cognomen*, which distinguished the family and answered to our surname. The principle of the modern system of designation is this: to have one name for the individual, joined to a second name which is common to the family or race to which he belongs, the first being the Christian name, and the latter the surname. [*See* NOUN, SURNAME.] —2. The letters or characters written or engraved, expressing the sounds by which a person or thing is known and distinguished.—3. A person.

It is generally of a yellow colour, but may be rendered colourless by distillation. Its specific gravity is about 0.75. It is highly inflammable, igniting even on the approach of a lighted taper, and burning with a white smoky flame. It appears to be a compound of 36 of carbon with 5 of hydrogen, and is therefore a pure hydro-carbon. Springs of naphtha exist in many countries, particularly in the neighbourhood of volcanoes. The finest varieties are found on the shores of the Caspian. It may be obtained by the distillation of asphaltum from the Dead Sea, and of petroleum from Trinidad. A liquid very similar to naphtha is obtained by the distillation of coal-tar, and has sometimes been used in lamps. It is in great repute as a solvent for caoutchouc in making water-proof cloth.

NAPHTHAL'AMIDE, *n.* [*naphtha*, and L. *lamina*, a plate.] A compound formed by heating naphthalate of ammonia in a retort. Ammonia and water are then disengaged, and naphthalamide sublimes without leaving any residue. This substance is colourless, inodorous, and insipid. When strongly heated it boils, emitting vapour, which condenses in crystalline plates When heated to 250° it loses water, and is changed into naphthalamide.

It is a white crystallizable substance consisting of hydrogen and carbon, heavier than water, and of a peculiar aromatic odour. It is extremely volatile, fusing at 176°, and its vapour condenses in large, white, flaky crystals. It burns with much smoke, and dissolves in alcohol and ether. It combines with sulphuric acid, forming two new compounds, namely, sulpha-naphthaline and sulpha-naphthalide.

Some of the more hardy species, as the daffodil, white narcissus, and pale narcissus or primrose-peerless (*N. biflorus*), grow wild in our woods, and under our hedges, but the finer sorts are natives of more southern latitudes. It often happens that many nations are subject to one government, in which case, the word *nation* usually denotes a body of people speaking the same language, or a body that has formerly been under a distinct government, but has been conquered, or incorporated with a larger nation. Thus the empire of Russia comprehends many *nations*, as did formerly the Roman and Persian empires. *Nation*, as its etymology imports, originally denoted a family or race of men descended from a common progenitor, like *tribe*, but by emigration, conquest, and intermixture of men of different families, this distinction is in most countries lost.—2. The national debt of Great Britain consists chiefly in stocks, which are variously designated according to the rate of interest which the government engages to pay, as the 3 and 3¼ per cent. stock, and partly from the financial operations, to which they have been subjected. [*See* STOCK.] Most of the public loans have been made upon interminable annuities, or until such time as the government might find it convenient to pay off the principal. In 1846, the total amount of the British National Debt was £782,918,948 sterling; the interest paid on which, in that year, was about 28¼ millions.—*National guard of France*, a military institution composed of citizens, and not incorporated with the standing army. It may in fact be considered the army of the people, in opposition to the standing force, considered as the army of the state. It is, therefore, not liable to be sent across the frontiers, except by the consent of the individuals composing it, but when the country is attacked, it is expected to act, with or without the aid of the regulars; also to concur with the latter in preserving public peace. The officers are elected by their comrades, and not appointed by the public authorities.

NAT'URAL, *a.* [Fr. *naturel;* L. *naturalis*, from *natura*, nature, from *nascor*, to be born or produced.] 1. Pertaining to nature; produced or effected by nature, or by the laws of growth, formation, or motion impressed on bodies or beings by divine power. Thus we speak of the *natural* growth of animals or plants; the *natural* motion of a gravitating body; *natural* strength or disposition; the *natural* heat of the body; *natural* colour; *natural* beauty. In this sense, *natural* is opposed to *artificial* or *acquired*.—2. According to the stated course of things. Poverty and shame are the *natural* consequences of certain vices.—3. Not forced; not far fetched; such as is dictated by nature. The gestures of the orator are *natural*.—4. Accord-

ing to the life; as, a *natural* representation of the face.—5. Consonant to nature.

Fire and warmth go together, and so seem to carry with them as *natural* an evidence as self-evident truths themselves. *Locke.*

6. Derived from nature, as opposed to *habitual*. The love of pleasure is *natural;* the love of study is usually habitual or acquired.—7. Discoverable by reason; not revealed; as, *natural* religion.—8. Produced or coming in the ordinary course of things, or the progress of animals and vegetables; as, a *natural* death; opposed to *violent* or *premature*.—9. Tender; affectionate by nature.—10. Unaffected; unassumed; according to truth and reality.

What can be more *natural* than the circumstances of the behaviour of those women who had lost their husbands on this fatal day? *Addison.*

11. Illegitimate; born out of wedlock; as, a *natural* son.—In *Scots law*, a *natural child* is the child of a woman who was not married to the father at the time of conception, and who never was thereafter married to him.—12. Native; vernacular; as, one's *natural* language.—13. Derived from the study of the works of nature; as, *natural* knowledge.—14. A *natural* note, in *music*, is that which is according to the usual order of the scale; opposed to *flat* and *sharp* notes, which are called *artificial*. *Natural religion*, belief in a God, and surmises of what is likely to be his will, drawn from the evidences of nature, without revelation.—*Natural history*, in its most extensive sense, is the description of whatever is created, or of the whole universe, including the heavens and the earth, and all the productions of the earth. But more generally, natural history is limited to a history and description of the natural products of the earth, whether minerals, animals, or vegetables, together with a scientific development of their causes and effects. It includes mineralogy, zoology, botany, geology, meteorology, &c. It teaches us the characteristics, or distinctive marks of each individual object, whether animal, vegetable, or mineral, and traces out its peculiar habits, qualities, uses, &c., and arranges individual objects together according to some system of classification.—*Natural philosophy*, the science of material natural bodies, of their properties, powers, and motions. It is distinguished from intellectual and moral philosophy, which respect the mind or understanding of man and the qualities of actions. It is the science which makes us acquainted with the various phenomena of natural or material objects; investigates the causes and effects of these phenomena, and thence deduces such general laws as may be applied to many useful purposes. Or it may be defined the science whose province it is to trace the chain of causes and effects in natural things, and to determine the laws of their relations. In its widest acceptation, natural philosophy, or physics, as it is frequently termed, comprehends natural history, chemistry, and mechanical or experimental philosophy, but it is usually restricted to the last of these branches, and includes the consideration of the general properties of bodies; mechanics, including dynamics and statics; hydrodynamics, including hydrostatics; hydraulics; and pneumatics; electricity, magnetism, and galvanism, and the connection which exists between these three; optics and astronomy. Natural philosophy is founded on observation, experiment, and reasoning by induction, and hence it has been called *experimental philosophy*, and also *inductive philosophy*. It has also received the name of *mechanical philosophy*, as it applies the truths of mechanics to physical inquiries. [*See* CHEMISTRY, PHILOSOPHY, PHYSICS.] —*Natural order of plants*, groups of genera which are supposed to bear a greater resemblance to each other than to any thing else. They constitute the foundation of all arrangements, and are wholly independent of the peculiar views which different writers have taken of the manner in which the vegetable kingdom should be otherwise classified. When systematical botany first assumed the semblance of science, we find the umbelliferous, leguminous, liliaceous, labiate, and composite orders more or less distinctly defined. It is, however, chiefly to the labours of Jussieu and his followers that the present improved limitation of natural orders is owing. Still all that has yet been effected is far from being satisfactory, and botanists have not hitherto settled what are really the essential characters by which natural orders ought to be precisely distinguished.—*Natural obligations*, in *Scots law*, those obligations which arise from the law of nature only, or from natural equity; such as the obligation on parents to provide for their children; or the obligation of a party who has bound himself by an informal writing to pay or to perform in terms of his engagement, even although, by reason of the informality, he may have contracted no binding obligation in law.—*Natural beds of a stone*, in *stratified rocks*, are the surfaces in which the laminæ separate. As all stones of this kind exfoliate rapidly when these surfaces of their *natural beds* are exposed to atmospheric influence, it becomes necessary, in using them in building, to lay them on their natural beds, or, in other words, so to place them in the wall that their exfoliating surfaces shall be horizontal or at right angles to the face of the wall. The contrary use of the stone is technically termed *setting it on edge*.

NAT'URAL, *n.* An idiot; one born without the usual powers of reason or understanding. This is probably elliptical for *natural fool*.—2.† A native; an original inhabitant.—3.† Gift of nature; natural quality.—4. In *music*, a character marked thus ♮, the use of which is to make a sharpened note a semitone lower, and a flattened one a semitone higher; or, in other words, it brings into the scale of the natural key of C any note which had been made sharp or flat. The power of this character, however, does not extend beyond the bar in which it appears, except where a lasting change of key is intended.

NAT'URALISM, *n.* Mere state of nature.—2. Religious knowledge which may be acquired by men's natural powers, without revelation.

This can only be done by act of parliament. [*See* ALIEN.]

Of a phœnix we say, there is no such thing in *nature*.

And look through *nature* up to *nature's* God. *Pope.*

2. By a metonymy of the effect for the cause, *nature* is used for the agent, creator, author, producer of things, or for the powers that produce them. By the expression, "trees and fossils are produced by *nature*," we mean, they are formed or produced by certain inherent powers in matter, or we mean that they are produced by God, the Creator, the Author of whatever is made or produced. The opinion that things are produced by inherent powers of matter, independent of a supreme

intelligent Author, is atheism. But generally men mean by *nature*, thus used, the Author of created things, or the operation of his power.—3. The essence, essential qualities, or attributes of a thing, which constitute it what it is; as, the *nature* of the soul; the *nature* of blood; the *nature* of a fluid; the *nature* of plants, or of a metal; the *nature* of a circle or an angle. When we speak of the *nature* of man, we understand the peculiar constitution of his body or mind, or the qualities of the species which distinguish him from other animals. When we speak of the *nature* of *a* man, or an individual of the race, we mean his particular qualities or constitution; either the peculiar temperament of his body, or the affections of his mind, his natural appetites, passions, disposition, or temper. So of irrational animals. —4. The established or regular course of things; as when we say, an event is not according to *nature*, or it is out of the order of *nature*.—5. A law or principle of action or motion in a natural body. A stone by *nature* falls, or inclines to fall. In the phrase, *laws of nature*, are included all properties of the different portions of the material world; all modes of action and rules of causation, according to which they operate on each other. The whole course of the visible universe, therefore, is but the collective result of such laws; its movements are only the aggregate of their working. All natural occurrences in the skies and on the earth, in the organic and in the inorganic world, are determined by the relations of the elements, and the actions of the forces of which the rules or laws are thus prescribed. To ascertain the *laws of nature*, or those fixed rules and principles which govern and regulate the whole course of nature, is the peculiar business of physical science.—*Law of nature*, or *natural law*, in a moral sense, is that sense of justice and that feeling of right and wrong experienced by every human being, and which has been emphatically described as a law written by the finger of God on the heart of man.—6. Constitution; aggregate powers of a body, especially a living one. We say, *nature* is strong or weak; *nature* is almost exhausted. —7. The constitution and appearances of things.

The works, whether of poets, painters, moralists, or historians, which are built upon general *nature*, live for ever. *Reynolds.*

8. Natural affection or reverence.

Have we not seen
The murdering son ascend his parent's bed,
Through violated *nature* force his way? *Pope.*

9. System of created things.

He, binding *nature* fast in fate,
Left free the human will. *Pope.*

10. Sort; species; kind; particular character.

A dispute of this *nature* caused a mischief to a king and an archbishop. *Dryden.*

11. Sentiments or images conformed to nature, or to truth and reality.

Only *nature* can please those tastes which are unprejudiced and refined. *Addison.*

12. Birth. No man is noble by *nature*. In the *fine arts*, *nature* often means the successful imitation of nature; but with artists of a higher order, *nature* does not signify a mere copy, but, as it were, the expression of the ideal of nature at which she aims in all her formations, yet without reaching it; as, for example, in crystallization she never produces precisely that mathematical figure which constitutes her model.

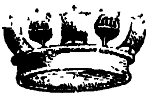
a tube passing through the disk. The nautilus is an inhabitant of the tropical seas. Three or four recent species are known. The organ of locomotion in the nautilus appears to be a foot resembling that of the snail; it resides in the cavity of its first or external chamber. A siphuncle connects the body

with the air-chambers, passing through an aperture and short projecting tube in each transverse septum till it terminates in the smallest chamber at the inner extremity of the shell. These internal chambers contain only air.



Section of Nautilus Pompilius.

By means of the siphuncle the animal is enabled to sink itself or to swim. Fossil remains of the nautilus are found in formations of every age —2. A loose popular name applied to the shells of several different genera of mollusca. The animal which is said to sail in its shell, upon the surface of the water, is the Argonauta Argo, very different from the nautilus. Perhaps nautilus may be said to be its poetical name.

NAVIGA'TION, *n.* [L. *navigatio*.] 1. The act of navigating; the act of passing on water in ships or other vessels —2. The art of conducting ships or vessels from one place to another. This art comprehends not only the management of the sails, but the directing and measuring of the course of ships by the laws of geometry, or by astronomical principles and observations. It is usually divided into navigation common, and navigation proper; the former relating to what is otherwise called coasting, and the other to those voyages made from one country to another through the trackless paths of the largest seas and oceans. Navigation turns chiefly upon four things, two of which being given or known, the rest are thence found out. These are the difference of latitude, difference of longitude, the reckoning or distance run, and the course or rhumb sailed on. The places of the sun, moon, planets, and fixed stars, are deduced from observation and calculation, and arranged in tables, the use of which is absolutely necessary in reducing observations taken at sea for the purpose of ascertaining the latitude and longitude of the ship, and the variation of the compass. The course and distance are ascertained by means of the log-line, or dead-reckoning, together with the compass. The problems in the various sailings are resolved either by trigonometrical calculation, or by tables or rules formed by the assistance of trigonometry. By mathematics, the necessary tables are constructed, and rules investigated for performing the more difficult parts of navigation. [*See* LATITUDE, LONGITUDE, RHUMB, SAILING, MIDDLE LATITUDE.]—*Navigation laws*, an important branch of maritime law, comprising the various acts that have been passed, defining British ships, the way in which such ships are to be manned, the peculiar privileges enjoyed by them, and the conditions under which foreign ships shall be allowed to engage in the trade of the country, either as importers or exporters of commodities, or as carriers of commodities from one part of the country to another.—3. All such vessels as are commanded by a commander. 3. All other smaller vessels, such as are commanded by lieutenants, or other inferior officers. The first class is subdivided into, First-rate, comprising all three-deckers. Second-rate, comprising all two-deckers, whose war complements consist of 700 men and upwards. Third-rate,—all ships whose complements are from 600 to 700. Fourth-rate,—ships whose complements are from 400 to 600. Fifth-rate, —ships whose complements are from 250 to 400. Sixth-rate,—ships under 250. The ministerial management of the royal navy of Great Britain is intrusted to five lords commissioners for executing the office of the lord high admiral of England, who are commonly known by the title of lords of the admiralty. Commissioners of the

navy are officers whose department is wholly distinct from that of the admiralty. The number of those resident in London is eight, and there are others stationed in different parts of the empire. They superintend the dockyards, and provide the vessels which the admiralty requires for service. To the royal navy there also belong a victualling office, an office of sick and wounded seamen, and a pay office. There are three gradations of admirals in the navy, viz., admirals, vice-admirals, and rear-admirals, and each of these dignities consists of three divisions, distinguished by the colour of their flags, the red, the white, and the blue; but all admirals take the common title of *flag-officers*. The command of each ship is intrusted to a captain or to a commander, who has under him a certain number of lieutenants according to the size of the ship, with a master, purser, midshipmen, gunners, &c. The navy is composed of two bodies of men, seamen, and marines (*see* MARINES), and the officers under whose command they are placed are divided into three classes, viz., commissioned, warrant, and petty officers.—3. NE'GRO, *n.* [It and Sp. *negro*, black, from L *niger.*] A native or descendant of the black race of men in Africa, called also the *Ethiopic race.* The word is never applied to the tawny or olive-coloured inhabitants of the northern coast of Africa, but to the more southern race of men who are quite black. Their native region seems to be the central portion of Africa. The seat of the black colour is the *rete mucosum*, and the external surface of the true skin. Negroes are not only distinguished from the other races by their colour, but also by various other peculiarities; such as the projection of the whole visage in advance of the forehead; the prolongation of the upper and lower jaws; the small facial angle; the flatness of the forehead and of the hinder part of the head; the woolly frizzled hair; the short, broad, and flat nose, and the thick projecting lips.

The true orthography, as this word is now pronounced, is *nehboor;* Sax. *neh*, nigh, and *boor.*] 1. One who lives near another. In large towns, a *neighbour* is one who lives within a few doors. In the country, a *neighbour* may live at a greater distance; and where the people are thinly scattered over the country, a *neighbour* may be distant several miles.—2. One who lives in familiarity with another; a word of civility.—3.† An intimate; a confident.—4 A fellow being; Acts vii.—5. NEITHER, *a. compound pronoun, pronominal adjective*, or *a substitute.* [Sax. *nather, nathor, nauther*, or *nouther; ne*, not, and *either* or *other*, not either, or not other. So in L. *neuter, ne* and *uter.*] Not either; not the one or the other. 1. It refers to individual things or persons; as, which road shall I take? *Neither*, take *neither* road. The upright judge inclines to *neither* party. It is used as a substitute; as, the upright judge inclines to *neither* of the parties.

He *neither* loves,
Nor either cares for him. *Shak*

2. It refers to a sentence; as, "ye shall not eat of it, *neither* shall ye touch it." That is, ye shall not eat, *not either* or *other* shall ye touch it; ye shall not eat, nor shall ye do the other thing here mentioned, that is, touch it; Gen. iii. "Fight *neither* with small nor great, save only with the king;" that is, fight not, either with small or great: 1 Kings xxii. *Neither*, in the first part of a negative sentence, is followed by *nor*, in the subsequent part. It is *neither*

the one *nor* the other. But *or* would be most proper, for the negative in *neither*, applies to both parts of the sentence. It is often used in the last member of a negative sentence instead of *nor*, as in the passage above cited. "Ye shall not eat it, *neither* shall ye touch it." Here *neither* is improperly used for *nor*, for *not* in the first clause refers only to that clause, and the second negative refers only to the second clause. "Ye shall *not* eat it, *nor* shall ye touch it." In the sentences above, *neither* is considered to be a conjunction or connecting word, though in fact it is a pronoun or representative of a clause of a sentence.—3. *Neither* primarily refers to *two*; not *either* of two. But by usage it is applicable to any number, referring to individuals separately considered. Five or ten persons being charged with a misdemeanour or riot, each may say, *neither* of us was present.—4. *Neither* sometimes closes a sentence in a peculiar manner; thus, "Men come not to the knowledge of ideas thought to be innate, till they come to the use of reason, nor then *neither*." That is, *not either* when they come to the use of reason, or before. Formerly, in English, as in Greek and French, two negatives were used for one negation. But in such phrases as that above, good speakers now use *either*; "nor then *either*."

The species are mostly herbaceous, and are usually covered with extremely fine, sharp, tubular hairs, placed upon minute vesicles, filled with an acrid and caustic fluid, which by pressure is injected into the wounds caused by the sharp-pointed hairs. Hence arises the well-known stinging sensation when these plants are incautiously handled. Many species of nettle are known, of which three are found in Britain—the Roman nettle; the small nettle; and the great nettle. Notwithstanding the acridity of nettles, they are, when young, used for food after being boiled, and form a favourite and wholesome ingredient in the spring-broth of the country people in many parts of England and Scotland. which is quite independent of any inflammation of the part, and which may often be traced in the course of the nerves. Such affections all come under the head of *neuralgia*.

NEUROLOG'ICAL, *a.* [*See* NEUROLOGY.] Pertaining to neurology, or to a description of the nerves of animals.

NEUROL'OGIST, *n.* One who describes the nerves of animals.

NEUROL'OGY, *n.* [Gr. νευρον, a nerve, and λογος, discourse.] A description of the nerves of animal bodies, or the doctrine of the nerves.

NEUROPTER, **NEUROP'TERA**, **NEUROP'TERANS**, *n.* [Gr. νευρον, a nerve, and πτερον, a wing.] The *neuropters* are an order of insects having four membranous, transparent, naked wings, reticulated with veins. They constitute the eighth order of insects in Cuvier's system. They are mostly bold, rapacious, and sanguinary; perpetually chasing and devouring other insects. The dragon-fly is a familiar example.

NEUTER, *a.* (nu'ter.) [L.; compounded of *ne* and *uter*, not either, not one nor the other.] 1. Not adhering to either party; taking no part with either side, either when persons are contending, or questions are discussed. It may be synonymous with *indifferent*, or it may not. The United States remained *neuter* during the French revolution, but very few of the people were *indifferent* as to the success of the parties engaged. A man may be *neuter* from feeling, and he is then *indifferent*: but he may be *neuter* in fact, when he is not in feeling or principle. A judge should be perfectly *neuter* in feeling, that he may decide with impartiality. —2. In *gram.*, of neither gender; an epithet given to nouns that are neither masculine nor feminine; primarily, to nouns which express neither sex.

NEUTER, *n.* A person that takes no part in a contest between two or more individuals or nations; a person who is either indifferent to the cause, or forbears to interfere.—2. An animal of neither sex, or incapable of propagation. The working bees are *neuters*.—*Neuter verb*, in *gram.*, a verb which expresses an action or state limited to the subject, and which is not followed by an object; as, I *go*; I *sit*; I *am*; I *run*; I *walk*. It is better denominated *intransitive*.

NEUTRAL, *a.* [Fr. *neutre*; L. *neutralis*, from *neuter*.] 1. Not engaged on either side; not taking an active part with either of contending parties. It is policy for a nation to be *neutral* when other nations are at war. Belligerents often obtain supplies from *neutral* states.—2. Indifferent; having no bias in favour of either side or party. —3. Indifferent; neither very good nor bad.

> Some things good, and some things ill do seem,
> And *neutral* some in her fantastic eye.
> *Davies.*

Neutral flowers or *florets*, in *bot.*, are such as contain neither stamens nor pistils, and of course produce no seeds. —*Neutral ship*, a ship that belongs to a nation, state, or port which is in amity with all those powers with which she may traffic.—*Neutral salts*. In *chem.*, this term formerly included such salts as did not obviously contain an excess either of acid or alkali, and this was determined by their action on vegetable colours. Those which evinced an acid property and reddened litmus paper were termed *super-salts*, or *acidulous salts*; and those which exhibited an alkaline property, and rendered turmeric paper yellow, were termed *sub-carbonates*. At present, however, the term neutral salt includes such compounds as are composed of one equivalent of each of their constituents, whatever may be their action on coloured tests, and whatever may be their taste.

NEUTRAL, *n.* A person or nation that takes no part in a contest between others.

> The *neutral*, as far as his commerce extends, becomes a party in the war.
> *R. G. Harper.*

NEUTRALIST, *n.* A neutral. [*Little us.*]

NEUTRAL'ITY, *n.* The state of being unengaged in disputes or contests between others; the state of taking no part on either side. In *international law*, that condition of a nation or state in which it does not take part directly or indirectly in a war between other states. A neutral state has the right of furnishing to either of the contending parties all supplies which do not fall within the description of *contraband of war*, which signifies in general, arms and munitions of war, and those out of which munitions of war are made. All such articles are liable to be seized. A neutral state has also the right to conclude such treaties with either belligerent party, as are unconnected with the subject of the war [*See* CONTRABAND.] States often arm to maintain their *neutrality*.—2. A state of indifference in feeling or principle.—3. Indifference in quality; a state neither very good nor evil. [*Lit. us.*]—4. A combination of neutral powers or states; as, the armed *neutrality*.

NEUTRALIZA'TION, *n.* [from *neutralize*.] 1. In *chem.*, the process by which an acid and an alkali are so combined as to disguise each other's properties, or render them inert. Thus, when sulphuric acid and soda are mixed together, the properties either of the one or the other preponderate according to the proportions of each, but there are certain proportions according to which when they are combined, they mutually destroy or disguise the properties of each other, so that neither predominates, or rather so that both disappear. When substances thus mutually disguise each other's properties they are said to *neutralize* each other. The term neutralization is also applied to the decomposition of the alkaline carbonates by the gradual addition of some acid more powerful than the carbonic.—2. The act of reducing to a state of indifference or neutrality.

NEUTRALIZE, *v. t.* To render neutral; to reduce to a state of indifference between different parties or opinions.—2. In *chem.*, to destroy or render inert or imperceptible the peculiar properties of a body by combining it with a different substance. Thus to *neutralize* acids and alkalies, is to combine them in such proportions that the compound will not exhibit the qualities of either.—3. To destroy the peculiar properties or opposite dispositions of parties or other things, or reduce them to a state of indifference or inactivity; as to *neutralize* parties in government; to *neutralize* opposition.

NEV'ER, *adv.* [Sax. *næfre*; ne, not, and *æfre*, ever.] 1. Not ever; not at any time; at no time. It refers to the past or the future. This man was *never* at Calcutta; he will *never* be there.—2. It has a particular use in the following sentences.

> Ask me *never* so much dower and gift; Gen. xxxiv.

> Which will not hearken to the voice of charmers, charming *never* so wisely; Ps. lviii.

> A fear of battery,—though *never* so well grounded, is no duress. *Blackstone.*

This is a genuine English use of *never*, found in our Saxon authors, and it ought to be retained. "Ask me so much dower as *never* was done;" that is, dower to any extent. The practice of using *ever* in such phrases is corrupt. It not only destroys the force but the propriety of the phrase.—3. In no degree; not.

> Whoever has a friend to guide him, may carry his eyes in another man's head, and yet see *never* the worse. *South.*

4. It is used for *not*. He answered him *never* a word; that is, *not ever*.

This use is not common.—5. It is much used in composition; as, in *never*-ending, *never*-failing, *never*-dying, *never*-ceasing, *never*-fading; but in all such compounds, *never* retains its true meaning.

In this use, *new* may be considered as adverbial, or as a part of the compound.

The large dogs which pass in this country for Newfoundland dogs are very different from the pure breed. The pure English Newfoundland dog is remarkable for his zeal, his devotedness, and entire abandonment of self, when he rushes to the rescue of some drowning wretch. As soon as he sees any body, or indeed any animal whatsoever struggling in the water, he jumps in, and seems to think that it is his duty never to leave them till he has got them out. He is confiding, sagacious, and capable of the warmest attachment to his master.

In the year 1842, stamps were issued to 369 newspapers, or other journals, in the following proportions for the metropolis and three Kingdoms: London, 81; other parts of England, 223; Wales, 13; Scotland, 66; Ireland, 88; Jersey, Guernsey, and the Isle of Man have several unstamped newspapers; as, also, are all those printed in the British colonies. In the United States, there are not less

Every publication giving original reports of parliamentary debates keeps one of a series of reporters constantly in the gallery of the lords, and another in the commons. These, like sentinels, are at stated periods relieved by their colleagues, when they take advantage of the interval to transcribe their notes, in order to be ready again to resume the duty of note-taking, and afterwards that of transcription for the press. A succession of reporters for each establishment, varying from ten or eleven to seventeen or eighteen, is thus maintained, and the process of writing from their notes never interrupted, till an account of the whole debates of the evening has been committed to the hands of the printer.

arch., niches were generally semicircular in the plan, and terminated in a semi-dome at the top. They were sometimes, however, square in the plan, and sometimes also square-headed.

They were ornamented with pillars, architraves, consoles, and in other ways. In the architecture of the middle ages niches were extensively used as decorations, and for the reception of statues. In the Norman style they were so shallow as to be little more than panels, and the figures were frequently carved on the back in alto-rilievo. In the early English style they become more deeply recessed, and are highly enriched, and in the decorated style they become infinitely varied. Their plans chiefly consisted of a semi-octagon or a semi-hexagon, and their heads were formed into groined vaults, with ribs, and bosses, and pendants. They were projected on corbels, and adorned with pillars, buttresses, and mouldings of various kinds, and had canopies added to them which were flat and projecting in every variety of plan, and elaborately carved and enriched. And in the perpendicular style this variety and elaboration continued.
